SIMPSON

Strong-Tie

People as reliable as our products.

Innovation means more when you can put it to work. That's why Simpson Strong-Tie supports you with a full lineup of quality products and dedicated professionals. Builders and specifiers choose our connectors for strength. But across the industry, we're also known for providing technical expertise when, where and how you want it — online, over the phone and in the field. So whether you're building a deck, home, condominium or subdivision, you can count on a team that shares your passion for building greatness.

Introduction

Since 1956, Simpson Strong-Tie has focused on creating structural products that help people build safer and stronger homes and buildings. A leader in structural systems research and technology, Simpson Strong-Tie is one of the largest suppliers of structural building products in the world. The Simpson Strong-Tie commitment to product development, engineering, testing and training is evident in the consistent quality and delivery of its products and services.

For more information, visit the company's website at strongtie.com.

The Simpson Strong-Tie Company Inc. No-Equal Pledge® includes:

- Quality products value-engineered for the lowest installed cost at the highest-rated performance levels
- The most thoroughly tested and evaluated products in the industry
- Strategically located manufacturing and warehouse facilities
- National code agency listings
- The largest number of patented connectors in the industry
- Global locations with an international sales team
- In-house R&D and tool and die professionals
- In-house product testing and quality control engineers
- Support of industry groups including AISI, AITC, ASTM, ASCE, AWC, AWWA, ACI, AISC, CSI, CFSEI, ICFA, NBMDA, NLBMDA, SBCA, SDI, SETMA, SFA, SFIA, STAFDA, SREA, NFBA, TPI, WDSC, WIJMA, WTCA and local engineering groups

The Simpson Strong-Tie Quality Policy

We help people build safer structures economically. We do this by designing, engineering and manufacturing No-Equal® structural connectors and other related products that meet or exceed our customers' needs and expectations. Everyone is responsible for product quality and is committed to ensuring the effectiveness of the Quality Management System.

Mike Olosky

Getting Fast Technical Support

When you call for engineering technical support, having the following information on hand will help us to serve you promptly and efficiently:

- Which Simpson Strong-Tie catalog are you using? (*See the front cover for the catalog number.*)
- Which Simpson Strong-Tie product are you using?
- What is your load requirement?
- What is the carried member's width and height?
- What is the supporting member's width and height?
- What is the carried and supporting members' material and application?

You should consult a qualified design professional familiar with all applicable building codes each time you use a Simpson Strong-Tie product.

New Products for 2024

APVKB Outdoor Accents® Avant Collection™ Knee Brace Connectors

APVKB knee brace connectors make installation of bracing supports fast and easy. Available in two sizes, APVKB45-4 and APVKB45-6, to accommodate 4x and 6x lumber respectively. Both sizes install with the 3½" structural wood screw and STN22 hex-head washer.

See p. 337 for more information.

APRT Rigid Tie® Connectors

Ideal for a variety of projects, our popular Rigid Tie connectors are now available in a black powder coat. ZMAX® galvanized steel, with a black powder-coat finish, provides medium corrosion protection. The APRTC2, APRTA2 and APRTR use the Outdoor Accents #10 x 1½" connector screw.

See p. 343 for more information.

SDWS25200DBB Outdoor Accents 2" Structural Wood Screw

The new 2" Outdoor Accents structural wood screw with the patented STN22 hex-head washer is a versatile, high-performance fastening solution, ideal for adding style to any DIY wood-to-wood project as well as 2x, 2x rough and 3x lumber connections using Outdoor Accents hardware.

See p. 339–340 for more information.

DGT™/DGHT™ Fire Wall Hangers

The patent-pending DGT and DGHT are load-tested fire wall hangers with a two-hour fire rating. Code listed to be installed with 1½" and 2½" power-driven or hand-installed nails, they provide space for two layers of ⅝" drywall to be slipped into place after the framing is complete.

See pp. 245–247 for more information.

ECB™ Elevated Column Base

The ECB elevated column base features a 2" standoff to provide space for waterproofing material and a finish surface while still maintaining the required 1" standoff to prevent post decay. Ideal for installing posts on stacked balconies in multifamily housing, it installs into concrete or wood.

See p. 86 for more information.

New Products for 2024

H1A Hurricane Tie

The next-generation H1A, designed for nominal 2x lumber, offers improved allowable uplift and F_2 lateral loads. Innovative embossments add stiffness for enhanced performance. It installs with only a single nail size and fewer nails overall than the previous model. These U-shaped hurricane ties provide faster installation than using two single-sided ties.

See pp. 287–289 for more information.

ACBH™ Concealed Beam Hanger

With an allowable stress design load capacity of up to 20 kips, the ACBH concealed beam hanger is the strongest connector in our line of concealed end-grain beam hangers. Its concealed connection allows for a wood-only aesthetic while offering one- and two-hour fire resistance ratings per ASTM E119.

See pp. 150–153 for more information.

HSKP™ Heavy Seated Knife Plate

The HSKP preserves the look of mass timber beams while meeting high-capacity needs. Offering the highest load ratings yet in our line of concealed beam hangers, the HSKP is tested for drift and listed in a code evaluation report. It installs in the factory with Strong-Drive® SDCF Timber-CF structural screws.

See pp. 154–155 for more information.

ICFVL™ ICF Ledger Connectors

The new ICFVL ledger connectors solve the challenges of mounting wood or steel ledgers to insulated concrete form (ICF) walls up to 4½" in thickness. The maximum ICF foam wall thickness for the ICFVL6 is 3¼", and the maximum ICF foam wall thickness for the new ICFVL8 is 4½".

See pp. 274–275 for more information.

ABA24-2Z Adjustable Post Base

The ABA24-2Z is designed for attaching double 2x lumber to existing concrete. It can be used for installing a structural post consisting of two 2x4 studs nailed together as well as for securing double 2x beams to a footing for ground-level decks.

See pp. 70–71 for more information.

New Products for 2024

SCLC™ Stair Cassette Ledger Connector

The SCLC offers a safer and more efficient way to connect preassembled stair cassettes to ledgers. It installs on the ledger in the factory with power-driven or hand-installed nails, and is fastened with Strong-Drive® SDS Heavy-Duty Connector screws on the jobsite once the cassette is securely seated.

See p. 119 for more information.

1616HTQ Heavy T Strap

The HTQ strap is a heavy, versatile utility strap designed for beam-to-pile connections. It's load rated and installs quickly and easily with the patented Strong-Drive SDWH™ Timber-Hex HDG screws.

See p. 281 for more information.

ACHZ™ Heavy Adjustable Post Cap

The ACHZ is a new heavier-capacity post cap, designed to provide a secure connection between a beam and a post. A two-piece design, it's ideal for new or retrofit applications where structural support is needed. ACHZ provides the flexibility for either mid-beam or end-beam connections when flanges are field bent.

See pp. 88–89 for more information.

MASOZ™/MASOPZ™ Mudsill Anchors

The MASOZ mudsill anchor for factory-built, sheathed wall panels provides an effective anchorage method that reduces on-site labor costs. It provides a convenient alternative to traditional cast-in-place anchors and eliminates the need for additional blocking and connectors required by our MASA product when used over sheathing.

See p. 32 for more information.

Discontinued Products

Products to Be Discontinued in 2024

Simpson Strong-Tie is dedicated to continuously expanding our line of structural connectors with innovative new products that address the changing needs of our customers. As new connectors are introduced that improve upon older designs, it becomes necessary to discontinue the old versions in the name of efficiency and product-line simplicity.

The table on the right lists products that are no longer included in the *Wood Construction Connectors* catalog as well as the products recommended to replace them. While technical information for discontinued products will be maintained on our website for a number of months, Simpson Strong-Tie asks that our customers begin to substitute the replacement products shown below in their designs and inventories. While it is hard to say when they will no longer be available from our distribution partners, production of some of these connectors ended in 2023 and others will be phased out of production in 2024. Verify with designer prior to substituting replacement product for specified product.

For the most current information on discontinued products, visit strongtie.com/discontinued. If you have questions about any of the products shown below, please call (800) 999-5099 for assistance.

Discontinued Product	Replacement Product (C-C-2024 Page #)
Column Bases	
ECBQ66-SDS / ECBQ88-SDS (Limited availability)	ECB66 / ECB88 (p. 86)
Hanger	
DGF / DGBF / DGHF (Limited availability)	DGT™ / DGHT™ (pp. 245–247)
Masonry	
ICFVL (Limited availability)	ICFVL6 / ICFVL8 (pp. 274–275)
Straps / Ties	
H1 (Limited availability)	H1A (pp. 287–289)
CS16SS (Limited availability)	No replacement
CSHP (Limited availability)	CS (pp. 283–285)

How We Determine Allowable Loads

Allowable loads in this catalog are determined by calculations and test criteria established by industry, such as ICC-ES Acceptance Criteria, IAPMO UES Evaluation Criteria and ASTM test standards.

Connectors are typically evaluated in accordance with ICC-ES AC13 — Acceptance Criteria for Joist Hangers and Similar Devices. Evaluation is based on a minimum of three static load tests in wood assemblies. The published allowable load is the lower of the tested ultimate with a safety factor of 3, load at 1/8" deflection or the NDS fastener calculation limits.

Holdowns and tension ties are tested in accordance with ICC-ES AC155 — Acceptance Criteria for Hold-Downs (Tie-Downs) Attached to Wood Members. Allowable loads are based on the lower of three static load tests with a safety factor, deflection limits or NDS fastener calculation limits. Static load tests include holdown testing on steel jigs and wood assembly tests.

Cast-in-place concrete products are tested in accordance with ICC-ES AC398 — Cast-in-Place, Cold-Formed Steel Connectors in Concrete for Light-Frame Construction or AC399 — Cast-in-Place Proprietary Bolts in Concrete for Light-Frame Construction. Threaded fasteners are evaluated per AC233 — Alternate Dowel-Type Threaded Fasteners.

Where a test standard is unavailable, testing is conducted per sound engineering principles. Some tests include only portions of a product, such as purlin anchor tests, wherein only the embedded hook is tested, not the nailed or bolted section of the strap, which is calculated. Testing to determine allowable loads in this catalog is not done on connection systems in buildings. Testing is conducted under the supervision of an independent laboratory.

For detailed information regarding how Simpson Strong-Tie tests specific products, contact Simpson Strong-Tie.

Load Table Explanation

Model No.:
This is the Simpson Strong-Tie product name.

Nails:
This shows the fastener quantity and type required to achieve the table loads.

Allowable Design Loads: The maximum load that a connection is designed to provide. There may be multiple design loads acting in different directions (up, down, lateral, perpendicular, etc.) imposed on a connection.

Uplift Down Lateral

Hanger Load Table Explanation, see p. 98.

Model No.	Dimensions (in.)			Nails (in.)	Allowable Loads					Code Ref.

Code Ref.:
See p. 13 for the Code Reference Key Chart, to determine which code reports include this product.

Wind or Seismic:
Some cast-in-place concrete products have different load ratings based on wind or seismic design category.

Product Drawing:
Provides a graphic presentation of the product with dimensional information (often cross-referenced to the table).

Dimensions W, L, H:
This shows the product dimensions (width, length and height in this case) referenced in the product drawing.

Fasteners: Nail dimensions are listed diameter by length. See pp. 23–24 for other nail sizes and information.

Throughout this catalog a footnote will typically be provided indicating the required nail diameter and length.

All installations should be designed only in accordance with the allowable load values set forth in this catalog.

Code Reports

Code Reference Column in Load Tables

Product evaluation agencies play an important role in the building industry providing an independent third-party review of architectural and structural products. Evaluations use publicly developed criteria to determine if the product meets the intent of the building code. Building officials can use product evaluation reports, often referred to as “code reports,” to review and approve product use on a project.

The most prominent architectural and structural building product certification companies are ICC Evaluation Service (ICC-ES) and IAPMO Uniform Evaluation Service (IAPMO UES), which are both ANSI-accredited to ISO Guide 65 “General Requirements for Bodies Operating Product Certification Systems” as product certification entities. Simpson Strong-Tie currently maintains more than 60 ICC-ES ESR and IAPMO UES ER reports evaluated to the 2006, 2009, 2012,

2015, 2018 and 2021 International Building Code® (IBC®) and International Residential Code® (IRC®). We continue to submit product information to evaluation agencies in order to update reports or receive additional reports for products in compliance with the latest codes. Simpson Strong-Tie also has reports for the City of Los Angeles, California and the State of Florida.

We have simplified our code references to make this catalog easier to use. You can quickly determine whether a product has a code report by looking in the Code Reference column of the product load tables. A summary of the code references used is in the table below.

To determine which specific code report applies to a product and download a copy of the code report, you can use our Code Report Finder at strongtie.com/codes.

Code Reference	Evaluation Agency	Building Code Coverage
IBC	ICC-ES IAPMO UES	International Building Code (IBC) International Residential Code (IRC)
FL	Florida Statewide Product Approval	Florida Building Code Visit strongtie.com/codes or floridabuilding.org for accurate and up-to-date product approval and evaluation reports.
LA	City of Los Angeles Department of Building Safety	Los Angeles Building Code and Los Angeles Residential Code These products have a City of LA supplement to their ICC-ES or IAPMO UES evaluation reports.
PR	Prescriptive	Products that meet prescriptive or conventional construction requirements.
—	None	No evaluation report listing.

How to Use This Catalog

• New Products

New products are shown with the  symbol. There are also many new sizes within existing model series.

• Changes in Orange

Significant changes from the previous catalog are indicated in orange.

Value Engineered

This icon indicates a product that is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

Extra Corrosion Protection

The teal arrow icon identifies products that are available with additional corrosion protection (ZMAX®, hot-dip galvanized or double-barrier coating). The SS teal arrow icon identifies products also available in stainless steel. Other products may also be available with additional protection; contact Simpson Strong-Tie for options. The end of the product name will indicate what type of extra corrosion protection is provided (Z = ZMAX, HDG = hot-dip galvanized or SS = stainless steel). Stainless products may need to be manufactured upon ordering. See p. 14 for information on corrosion, and visit our website strongtie.com/info for more technical information on this topic.

Strong-Drive® SD Connector Screw Compatible

This icon identifies products approved for installation with Simpson Strong-Tie Strong-Drive SD Connector screw. See pp. 362–366 for more information or visit our [SD screw compatibility reference at strongtie.com/sd](https://strongtie.com/sd).

Corrosion Information

Understanding the Corrosion Issue

Metal connectors, fasteners and anchors can corrode and lose carrying capacity when installed in corrosive environments or when installed in contact with corrosive materials. The many variables present in a building environment make it impossible to predict accurately whether, or when, corrosion will begin to reach a critical level. This relative uncertainty makes it crucial that specifiers and users be knowledgeable about the potential risks and select a product suitable for the intended use. When there is any uncertainty about the possible corrosion risks of any installation, a qualified professional should be consulted. Because of the risks posed by corrosion, periodic inspections should be performed by a qualified engineer or qualified inspector and maintenance performed accordingly.

It's common to see some corrosion in outdoor applications. Even stainless steel can corrode. The presence of some corrosion does not mean that load capacity has been affected or that failure is imminent. If significant

corrosion is apparent or suspected, then the wood, fasteners, anchors, and connectors should be inspected by a qualified engineer or qualified inspector. Replacement of affected components may be appropriate.

Because of the many variables involved, Simpson Strong-Tie cannot provide estimates of the service life of connectors, anchors, and fasteners. We suggest that all users and specifiers obtain recommendations on corrosion from the suppliers of the materials that will be used with Simpson Strong-Tie products, in particular, treated wood or concrete. We have attempted to provide basic knowledge on the subject here, and have additional information in our technical bulletins on the topic (strongtie.com/info). The Simpson Strong-Tie website should always be consulted for the latest information.

Corrosion Conditions

Corrosion can result from many combinations of environmental conditions, materials, construction design, and other factors, and no single guideline addresses all corrosion possibilities. Nevertheless, important corrosion information can be obtained from the American Wood Protection Association (AWPA), the International Building Code® (IBC®), International Residential Code® (IRC®), and local building codes. The following discussion provides general guidelines and approaches for the selection of Simpson Strong-Tie products for various construction conditions, but is not intended to supersede the guidelines of the AWPA, IBC, IRC, or local building codes.

Corrosion issues for Simpson Strong-Tie products generally fall into five categories:

1. Environmental and Construction Factors

Many environments and materials can cause corrosion, including ocean salt air, condensation, duration of wetness, fire retardants, fumes, fertilizers, chlorides, sulfates, preservative-treated wood, de-icing salts, dissimilar metals, soils, and more. Designers must take all of these factors into account when deciding which Simpson Strong-Tie products to use with which corrosion-resistant coatings or materials.

The design, quality of construction, and misinstallation can directly affect the corrosion resistance of products. A product intended and installed for use in dry-service environment may corrode if the structure design or building materials allow moisture intrusion, or expose the product to corrosive conditions, such as moisture or chemicals contained in the construction materials, soils, or atmospheres.

2. Chemically Treated Lumber

Some wood-preservative or fire-retardant chemicals or chemical retention levels create increased risk of corrosion and are corrosive to steel connectors and fasteners. For example, testing by Simpson Strong-Tie has shown that ACQ-Type D is more corrosive than Copper Azole, Micronized Copper Azole, or CCA-C. At the same time, other tests have shown that inorganic boron treatment chemicals, specifically SBX-DOT, are less corrosive than CCA-C.

Because different chemical treatments of wood have different corrosion effects, it's important to understand the relationship between the wood treatment chemicals and the coatings and base metals of Simpson Strong-Tie products.

The preservative-treated wood supplier should provide all of the pertinent information about the treated wood product. The information should include the AWPA Use Category Designation, wood species group, wood treatment chemical, and chemical retention. See building code requirements and appropriate evaluation reports for corrosion effects of wood treatment chemicals and for fastener corrosion resistance recommendations.

With Fire-Retardant (FRT) Wood, the 2015 and 2018 IBC Section 2304.10.5, 2021 IBC Section 2304.10.6, and 2015, 2018 and 2021 IRC Section R317.3.4 refer to the manufacturers for fastener corrosion requirements. In the absence of recommendations from the FRT manufacturer, the building codes require fasteners to be hot-dip

galvanized, stainless steel, silicon bronze or copper. Simpson Strong-Tie further requires that the fastener is compatible with the metal connector hardware. Fastener shear and withdrawal allowable loads may be reduced in FRT lumber. Refer to the FRT manufacturer's evaluation report for potential reduction factors.

3. Dissimilar Metals and Galvanic Corrosion

Galvanic corrosion occurs when two electrochemically dissimilar metals contact each other in the presence of an electrolyte (such as water) that acts as a conductive path for metal ions to move from the more anodic to the more cathodic metal. Good detailing practice, including the following, can help reduce the possibility of galvanic corrosion of fasteners and connectors:

- Use fasteners or anchors and connectors with similar electrochemical properties
- Use insulating materials to separate dissimilar metals
- Ensure that the fastener or anchor is the cathode when dissimilar connector metals are present
- Prevent exposure to and pooling of electrolytes

Galvanic Series of Metals

Corroded End (Anode)
Magnesium, Magnesium alloys, Zinc
Aluminum 1100, Cadmium, Aluminum 2024-T4, Iron and Steel
Lead, Tin, Nickel (active), Inconel Ni-Cr alloy (active), Hastelloy alloy C (active)
Brasses, Copper, Cu-Ni alloys, Monel
Nickel (passive)
304 stainless steel (passive), 316 stainless steel (passive), Hastelloy alloy C (passive)
Silver, Titanium, Graphite, Gold, Platinum
Protected End (Cathode)

If you are uncertain about the galvanic corrosion potential of any installation, always consult with a corrosion expert. See the product pages for particular parts for more information regarding what coating systems are recommended or required for use with the parts in question.

4. Hydrogen-Assisted Stress Corrosion Cracking

Some hardened fasteners may experience premature failure from hydrogen-assisted stress-corrosion cracking if exposed to moisture. These fasteners are recommended for use only in dry-service conditions.

5. Indoor Swimming Pools

Indoor swimming pool environments are extremely corrosive to steel products. And some stainless steel is highly susceptible to stress corrosion cracking (SCC) under sustained loads in this environment. SCC can result in sudden failures. Instead of stainless steel, it is advised to use a duplex coated, post-hot-dip galvanized or ZMAX® coated low carbon steel for any load bearing components used in swimming pool environments. Regular maintenance is strongly advised. See strongtie.com/corrosion for additional information.

Corrosion Information

Guidelines for Selecting Materials and Coatings

In the discussion and charts of this section, Simpson Strong-Tie presents a three-step system to determine which product coatings and base metals to use in a range of corrosion conditions. These are general guidelines that may not consider all relevant application criteria. Refer to product-specific information for additional guidance.

Simpson Strong-Tie evaluated the AWP A Use Categories (See AWP A U1-16) and ICC-ES AC257 Exposure Conditions and developed a set of corrosion resistance recommendations. These recommendations

address the coating systems and materials used by Simpson Strong-Tie for fastener, connector, and anchor products. Although the AWP A Use Categories and ICC-ES AC257 Exposure Conditions specifically address treated-wood applications and some common corrosion agents, Simpson Strong-Tie believes that its recommendations may be applied more generally to other application conditions, insofar as the service environments discussed are similar. You should consult with a corrosion engineer concerning the application where advisable.

Step 1 of 3 — Evaluate The Corrosion Conditions

- **Dry Service:** Generally INTERIOR applications including wall and ceiling cavities, and in raised floor applications in enclosed buildings that have been designed to prevent condensation and exposure to other sources of moisture. Prolonged periods of wetness during construction should also be considered, as this may constitute a Wet Service or Elevated Service condition. Dry Service is typical of AWP A UC1 and UC2 for wood treatment and AC257 Exposure Condition 1. Keep in mind that dry-service environment may contain airborne salts. AC257 Exposure Condition 2 reflects the presence of airborne salt in a dry-service environment and corrosion hazard to exposed metal surfaces. It does not include effects of treatment chemicals. This condition is generally considered in Elevated and Uncertain assessments.
- **Wet Service:** Generally EXTERIOR construction in conditions other than elevated service. These include Exterior Protected and Exposed and General Use Ground Contact as described by AWP A UC4A. The AWP A U1 standard classifies exterior above-ground treatments as Use Categories UC3 (A and B) depending on moisture run-off; and for exterior ground-contact levels of protection, it has Use Categories UC4 (A-C). ICC-ES AC257 considers the exterior exposure to be limited by the presence of treatment chemicals, and corrosion accelerators. In general, the AC257 Exposure Condition 1 includes AWP A Use Categories UC1 (interior/dry) and UC2 (interior/damp), while Exposure Condition 3 is a surrogate to UC3A, 3B, and 4A (exterior, above-ground and ground-contact, general use). The ICC-ES AC257 Exposure Conditions 2 and 4 are exposures that are salt environments.
- **Elevated Service:** Includes fumes, fertilizers, soil, some preservative-treated wood (AWP A UC4B and UC4C), industrial-zone atmospheres, acid rain, salt air, and other corrosive elements.
- **Uncertain:** Unknown exposure, materials, or treatment chemicals.
- **Ocean/Water Front Service:** Marine environments that include airborne chlorides, salt air, and some salt splash. Environments with de-icing salts are included.

Step 2 of 3 — Determine Your Corrosion Resistance Classification

Corrosion Resistance Classifications

Environment	Material to Be Fastened						
	Untreated Wood or Other Material	Preservative-Treated Wood					FRT Wood
		SBX-DOT Zinc Borate	Chemical Retention ≤ AWP A, UC4A	Chemical Retention > AWP A, UC4A	ACZA	Other or Uncertain	
Dry Service	Low	Low	Low	High	Medium	High	Medium
Wet Service	Medium	N/A	Medium	High	High	High	High
Elevated Service	High	N/A	Severe	Severe	High	Severe	N/A
Uncertain	High	High	High	Severe	High	Severe	Severe
Ocean/Water Front	Severe	N/A	Severe	Severe	Severe	Severe	N/A

Additional Considerations

1. Always consider the importance of the connection as well as the cost of maintenance and replacement.
2. If the information about treatment chemicals in an application is incomplete, or if there is any uncertainty as to the service environment of any application, Simpson Strong-Tie recommends the use of a Type 300 Series stainless steel. Simpson Strong-Tie has evaluated the corrosion effects of various formulations of wood treatment chemicals ACZA, ACQ, CCA, MCA, CA, and salt as corrosion accelerators. Simpson Strong-Tie has not evaluated all formulations and retentions of the named wood treatment chemicals other than to use coatings and materials in the severe category. Manufacturers may independently provide test results or other product information. Simpson Strong-Tie expresses no opinion regarding such information.
3. Type 316/305/304 stainless-steel products are recommended where preservative-treated wood used in ground contact has a chemical retention level greater than those for AWP A UC4A; CA-C, 0.15 pcf (pounds per cubic foot); CA-B, 0.21 pcf; micronized CA-C, 0.14 pcf; micronized CA-B, 0.15 pcf; ACQ-Type D (or C), 0.40 pcf. When wood treated with micronized CA-C and micronized CA-B with treatment retentions up to UC4B is in dry service, hot-dip galvanized fasteners and connectors may be suitable.
4. Mechanical galvanizations C3 and N2000 should not be used in conditions that would be more corrosive than AWP A UC3A (exterior, above ground, rapid water run off).
5. Some chemically treated wood may have chemical retentions greater than specification, particularly near the surface, making it potentially more corrosive than chemically treated wood with lower retentions. If this condition is suspected, use Type 316/305/304 stainless-steel, silicon bronze, or copper fasteners.
6. Some woods, such as cedars, redwood, and oak, contain water-soluble tannins and are susceptible to staining when in contact with metal connectors and fasteners. According to the California Redwood Association (calredwood.org), applying a quality finish to all surfaces of the wood prior to installation can help reduce staining.
7. Anchors, fasteners and connectors in contact with FRT lumber shall be hot-dip galvanized or stainless steel, unless recommended otherwise by the FRT manufacturer. Many FRT manufacturers permit low-corrosion-resistant connector and fastener coatings for dry-service conditions.
8. Simpson Strong-Tie does not recommend painting stainless-steel anchors, fasteners or connectors. Imperfections or damage to the paint can facilitate collection of dirt and water that can degrade or block the passive formation of the protective chromium oxide film. When this happens, crevice corrosion can initiate and eventually become visible as a brown stain or red rust. Painting usually does not improve the corrosion resistance of stainless steel.

Corrosion Information

Guidelines for Selecting Materials and Coatings (cont.)

Step 3 of 3 — Match Your Corrosion Resistance Classification to the Coatings and Materials Available

Not all products are available in all finishes. Contact Simpson Strong-Tie for product availability, ordering information and lead times.

Coatings and Materials Available for Connectors

Level of Corrosion Resistance	Coating or Material	Description	
Connectors			Compatible Fastener/Anchor Material or Finish
Low	Gray or Black Paint	Organic paint intended to protect the product while it is warehoused and in transit to the jobsite.	Bright, Hot-Dip Galvanized, Mechanically Galvanized, or Double-Barrier Coating
	Powder Coating	Baked-on paint finish that is more durable than standard paint.	
	Galvanized	Standard (G90) zinc-galvanized coating containing 0.90 oz. of zinc per square foot of surface area (per ASTM A653) total for both sides.	
Medium		Galvanized (G185) 1.85 oz. of zinc per square foot of surface area (hot-dip galvanized per ASTM A653) total for both sides. Products with a powder-coat finish over a ZMAX® base have the same level of corrosion resistance.	Hot-Dip Galvanized, Mechanically Galvanized, or Double-Barrier Coating <i>* Bright fasteners may be used with ZMAX or HDG connectors where low corrosion resistance is allowed.</i>
		Products are hot-dip galvanized after fabrication (14 ga. and thicker). The coating weight increases with material thickness. The minimum average coating weight is 2.0 oz./ft. ² (per ASTM A123) total for both sides. Anchor bolts are hot-dip galvanized per ASTM F2329.	
High/Severe	 Type 316 Stainless Steel	Type 316 stainless steel is a nickel-chromium austenitic grade of stainless steel with 2–3% molybdenum. Type 316 stainless steel is not hardened by heat treatment and is inherently nonmagnetic. It provides a level of corrosion protection suitable for severe environments, especially environments with chlorides.	Type 316 Stainless Steel

Wet Service

Elevated Service / Severe

Corrosion Information

Guidelines for Selecting Materials and Coatings (cont.)

Step 3 of 3 — Match Your Corrosion Resistance Classification to the Coatings and Materials Available (cont.)

Not all products are available in all finishes. Contact Simpson Strong-Tie for product availability, ordering information and lead times.

Coatings and Materials Available for Fasteners

Level of Corrosion Resistance	Coating or Material	Description	
		Fasteners	Applicable Products
Low	Bright	No surface coating.	Nails
	Electrocoating (E-Coat)	Electrocoating utilizes electrical current to deposit the coating material on the fastener. After application, the coating is cured in an oven. Electrocoating provides a minimum amount of corrosion protection and is recommended for dry, low-corrosive applications.	Strong-Drive® SDWF FLOOR-TO-FLOOR, SDW™ TRUSS-PLY, SDW EWP-PLY and SDWV SOLE-TO-RIM Screws
	Clear, Yellow and Bright-Blue Zinc	Zinc coatings applied by electrogalvanizing processes to fasteners that are used in dry service and with no environmental or material corrosion hazard.	Strong-Drive SDCF TIMBER-CF Screw SDHR COMBO-HEAD Screw SD8 Wafer Head Screw
Medium	Zinc Plating with Baked-On Ceramic Coating	A baked ceramic barrier coating applied over top of electroplated zinc provides increased protection in mildly corrosive environments.	Titen Turbo™ Concrete and Masonry Screw
	 ASTM A153, Class D	Hot-dip galvanized fasteners 3/8" and smaller in diameter in accordance with ASTM A153, Class D. Hot-dip galvanized fasteners are compliant with the 2015, 2018 and 2021 IRC® and IBC®.	Strong-Drive SCN CONNECTOR Nail
	Type 410 Stainless Steel with Protective Top Coat	Carbon martensitic grade of stainless steel that is inherently magnetic, with an added protective top coat. This material can be used in mild atmospheres and many mild chemical environments.	Titen® Stainless-Steel Concrete and Masonry Screw
	Mechanically Galvanized Coating, ASTM B695	Simpson Strong-Tie Strong-Drive SD Connector screws are manufactured with a mechanically applied zinc coating in accordance with ASTM B695, Class 55, with a supplemental overcoat. Titen HD® Mechanically Galvanized anchors comply with ASTM B695, Class 65. These fasteners are compatible with painted and zinc-coated (G90 and ZMAX®) connectors and are recognized in evaluation reports that can be found on strongtie.com .	Strong-Drive SD CONNECTOR Screw Titen HD Mechanically Galvanized
	Double-Barrier Coating	Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws and Outdoor Accents® structural wood screws are manufactured with double-barrier coating that provides a level of corrosion protection equaling that provided by HDG coating and are recognized in evaluation reports that can be found on strongtie.com .	Strong-Drive SDS HEAVY-DUTY CONNECTOR Screw Outdoor Accents Connector Screw and Structural Wood Screw
High/Severe	 ASTM A153, Class C	Simpson Strong-Tie Strong-Drive Timber-Hex screws are hot-dip galvanized in accordance with ASTM A153, Class C. These hot-dip galvanized fasteners have a minimum average of 1.25 oz./ft. ² of zinc coating and are compliant with the 2015, 2018 and 2021 IRC (R317.3) and IBC.	Strong-Drive TIMBER-HEX HDG Screw
	 Type 316 Stainless Steel	Type 316 stainless steel is a nickel-chromium austenitic grade of stainless steel with 2–3% molybdenum. It provides a level of corrosion protection suitable for severe environments, especially environments with chlorides. Type 316 stainless-steel fasteners are compliant with the 2015, 2018 and 2021 IRC and IBC. Important Information and General Notes

Warning

Simpson Strong-Tie Company Inc. structural connectors, anchors, and other products are designed and tested to provide specified design loads. To obtain optimal performance from Simpson Strong-Tie products and achieve maximal allowable design load, the products must be properly installed and used in accordance with the corrosion information, installation instructions and design limits provided by Simpson Strong-Tie. To ensure proper installation and use, designers and installers must carefully read the following General Notes, General Instructions for the Installer, General Instructions for the Designer and Corrosion Information, as well as consult the applicable catalog pages for specific product installation instructions and notes.

Proper product installation requires careful attention to all notes and instructions, including these basic rules:

1. Be familiar with the application and correct use of the connector.
2. Read and follow all instructions and warnings on our website, in this and any other applicable catalog, in the *Installer's Pocket Guide* and all other Simpson Strong-Tie publications. If any instructions or warnings are unclear, do not use the product and contact Simpson Strong-Tie.
3. Install all required fasteners per installation instructions provided by Simpson Strong-Tie: (a) use proper fastener type; (b) use proper fastener quantity; (c) fill all fastener holes; (d) do not overdrive or underdrive nails, including when using power nailers; and (e) ensure screws are completely driven.
4. Only bend products that are specifically designed to be bent. For those products that require bending (such as strap-type holdowns, straight-end twist straps, etc.), do not bend more than one full cycle.
5. Cut joists to the correct length, do not "short-cut." The gap between the end of the joist and the header material should be no greater than 1/8" unless otherwise noted.
6. Wear head, skin, eye and ear protection when installing the products or visiting a jobsite.

Failure to follow fully all of the notes and instructions provided by Simpson Strong-Tie may result in improper installation of products. Improperly installed products may not perform to the specifications set forth in this catalog and may reduce a structure's ability to resist the movement, stress, and loading that occurs from gravity loads as well as impact events such as earthquakes and high-velocity winds.

Simpson Strong-Tie provides no warranty for any products that have been modified, improperly installed or not used in accordance with the information set forth in this catalog or on our website.

Important Information

In addition to following the basic rules provided above as well as all notes, warnings and instructions provided in the catalog, installers, designers, engineers and consumers must consult the Simpson Strong-Tie website at strongtie.com each time a product is used to obtain additional design and installation information.

Simpson Strong-Tie Limited Warranty

For the Limited Warranty that applies to Simpson Strong-Tie products, please consult strongtie.com/limited-warranties. See p. 371 for the Limited Warranty in effect when this catalog was first published. To obtain a copy of the current Limited Warranty, contact us at limited_warranty@strongtie.com, (800) 999-5099 or Simpson Strong-Tie Company Inc., 5956 West Las Positas Boulevard, Pleasanton, CA 94588.

The Limited Warranty contains important disclaimers, limitations and exclusions, and applies only if the products have been properly specified, installed, maintained, and used in accordance with the design limits and the structural, technical, and environmental specifications in the Simpson Strong-Tie Documentation. All future purchases of Simpson Strong-Tie products are subject to the terms of the Limited Warranty in effect as of the purchase date.

Although products are designed for a wide variety of uses, Simpson Strong-Tie assumes no liability for confirming that any product is appropriate for an intended use, and each intended use of a product must be reviewed and approved by qualified professionals. Each product is designed for the load capacities and uses listed in the Simpson Strong-Tie Documentation, subject to the limitations and other information set forth therein. Due to the particular characteristics of potential impact events such as earthquakes and high velocity winds, the specific design and location of the structure, the building materials used, the quality of construction, or the condition of the soils or substrates involved, damage may nonetheless result to a structure and its contents even if the loads resulting from the impact event do not exceed Simpson Strong-Tie's specifications and the products are properly installed in accordance with applicable building codes, laws, rules and regulations.

Terms and Conditions of Sale

Product Use

Products in this catalog are designed and manufactured for the specific purposes shown, and should not be used with other connectors not approved by a qualified licensed/certified building design professional, a licensed professional engineer or licensed architect ("designer"). You should review our website and consult a qualified designer familiar with all applicable building codes each time you use a Simpson Strong-Tie product.

Indemnity

Any designer or other person who modifies any products, changes any installation procedures or designs any non-catalog products for fabrication by Simpson Strong-Tie Company Inc. shall, regardless of specific instructions to the user, indemnify, defend, and hold harmless Simpson Strong-Tie Company Inc. for any and all claimed loss or damage occasioned in whole or in part by such products.

Non-Catalog and Modified Products

Modifications to products or changes in installation procedures should

only be made by a qualified professional designer. The performance of such modified products or altered installation procedures is the sole responsibility of the designer. Any person modifying Simpson Strong-Tie products must provide the installer with specific instructions on the modified products' specifications, installation and use.

Consult Simpson Strong-Tie Company Inc. for applications for which there is no catalog product, or for connectors for use in hostile environments, with excessive wood shrinkage, or with abnormal loading or erection requirements.

Non-catalog products must be designed by a qualified designer and will be fabricated by Simpson Strong-Tie in accordance with customer specifications.

Any modified, special order or non-catalog products, or any products that are not installed strictly in accordance with Simpson Strong-Tie installation procedures, are provided "AS IS" and without any representation or warranty of any kind.

Important Information and General Notes

General Notes

These general notes are provided to ensure proper installation of Simpson Strong-Tie products and must be followed fully.

- Simpson Strong-Tie reserves the right to change specifications, designs and models without notice or liability for such changes. Review our website each time you use our products.
- Steel used for each Simpson Strong-Tie product is individually selected based on the product's steel specifications, including strength, thickness, formability, finish and weldability. Contact Simpson Strong-Tie for steel information on specific products.
- Unless otherwise noted, dimensions are in inches, loads are in pounds.
- Unless otherwise noted, welds, screws, bolts and nails may not be combined to achieve highest load value. 0.131" x 2½", 0.148" x 3" and 0.162" x 3½" specify common nails that meet the requirements of ASTM F1667. When a shorter nail is specified, it will be noted (for example 0.131" x 1½"). Refer to Simpson Strong-Tie Nailing Guide, NDS (National Design Specification) and ASTM F1667 (American Society of Testing and Materials) for more nail info.
- Do not overload. Do not exceed catalog allowable loads.
- Unless otherwise noted, allowable loads are for Douglas Fir-Larch under continuously dry conditions. Allowable loads for other species or conditions must be adjusted according to the code. **Allowable loads for alternate species may be determined as outlined in Simpson Strong-Tie engineering letter L-ALTSPECIES on strongtie.com.** This chart shows specific gravity and perpendicular-to-grain compression capacities for the different wood species:

Species	F _{c⊥}	Specific Gravity
Douglas fir-larch (DF)	625 psi	0.50
Southern pine (SP)	565 psi	0.55
Spruce-pine-fir (SPF)	425 psi	0.42
Hem-fir (HF)	405 psi	0.43
Spruce-pine-fir south (SPF-S)	335 psi	0.36
Western Cedar	425 psi	0.36
Glulam	650 psi	0.50
LVL (DF/SP)	750 psi	0.50
LSL (E = 1.3 x 10 ⁶)	680 psi	0.50
LSL (E ≥ 1.5 x 10 ⁶)	880 psi	0.50
Parallam® PSL	625 psi	0.50
- Simpson Strong-Tie Company Inc. will manufacture non-catalog products provided prior approval is obtained and an engineering drawing is included with the order. Steel specified on the drawings as ⅛", ⅜" and ¼" will be 11 ga. (0.120"), 7 ga. (0.179") and 3 ga. (0.239"), respectively. The minimum yield and tensile strengths are 33 ksi and 52 ksi, respectively.
- All references to bolts are for structural quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM Standard A307, Grade A. **Nuts shall be ASTM A563, Grade A or better, unless noted otherwise.**
- Unless otherwise noted, bending steel in the field may cause fractures at the bend line. Fractured steel will not carry load and must be replaced.
- A fastener that splits the wood will not take the design load. Evaluate splits to determine if the connection will perform as required. Dry wood may split more easily and should be evaluated as required. If wood tends to split, consider pre-boring holes with diameters not exceeding 0.75 of the nail diameter (2015/2018 NDS 12.1.5.3). Use a ⅝" bit for Strong-Drive® SDS Heavy-Duty Connector screws and a ⅜" bit for Strong-Drive SD9/SD10 Connector screws.
- Wood shrinks and expands as it loses and gains moisture, particularly perpendicular to its grain. Take wood shrinkage into account when designing and installing connections. Simpson Strong-Tie manufactures products to fit common dry-lumber dimensions. If you need a connector with dimensions other than those listed in this catalog, Simpson Strong-Tie may be able to vary connector dimensions; contact Simpson Strong-Tie. The effects of wood shrinkage are increased in multiple lumber connections, such as floor-to-floor installations. This may result in the vertical rod nuts becoming loose, requiring post-installation tightening. (Reference ICC-ES ESR-2320 for information on Take Up Devices.)
- Top-flange hangers may cause unevenness. Possible remedies should be evaluated by a professional and include using a face-mount hanger, and routing the beam or cutting the subfloor to accommodate the top flange thickness.
- Built-up lumber (multiple plies) must be fastened together to act as one unit to resist the applied load (fastening of the members together does not include the connector fasteners). This must be determined by the designer.
- Some model configurations may differ from those shown in this catalog. Contact Simpson Strong-Tie for details.
- Hanger Options (Simpson Strong-Tie Hanger Options Matrix and Hanger Option General Notes pp. 101–103) — some combinations of hanger options are not available. In some cases, combinations of these options may not be installable. Horizontal loads induced by sloped joists must be resisted by other members in the structural system.
- A qualified designer must always evaluate each connection, including carried and carrying member limitations, before specifying the product. Fill all fastener holes with fastener types specified in the tables, unless otherwise noted. Hanger configurations, height and fastener schedules may vary from the tables depending on joist size, skew and slope. See the allowable table load for the non-modified hanger, and adjust as indicated. Gauge may vary from that specified depending on the manufacturing process used. Simpson Strong-Tie will calculate the net height for a sloped seat. The customer must provide the H1 joist height before slope.
- Truss plates shown are the responsibility of the truss designer.
- Do not weld products listed in this catalog unless this publication specifically identifies a product as acceptable for welding, or unless specific approval for welding is provided in writing by Simpson Strong-Tie. Some steels have poor weldability and a tendency to crack when welded. Cracked steel will not carry load and must be replaced. See Simpson Strong-Tie Hanger Options Matrix and Hanger Option General Notes on pp. 101–103 for hangers that may be welded and Straps and Ties General Notes on pp. 276–277 for straps that may be welded.
- Unless noted otherwise, all references to standard-cut washers refer to Type A plain washers (W) conforming to the dimensions shown in ASME B18.22.1 for the appropriate rod size in accordance with 2015/2018 NDS Appendix L. Some products require SAE narrow washers (N) to fit in a tight space and are noted accordingly.
- To achieve tabulated values for embedded concrete/masonry products, full consolidation of concrete or grout is required whether mounted to the form prior to the pour or wet set.

Important Information and General Notes

General Instructions for the Installer

These general instructions for the installer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific installation instructions and notes provided for each particular product, all of which should be consulted prior to and during installation of Simpson Strong-Tie Company Inc. products.

- a. All specified fasteners must be installed according to the instructions in this catalog. Incorrect fastener quantity, size, placement, type, material, or finish may cause the connection to fail. Prior to using a particular fastener, please consult Connector Fastener types on pp. 23–24.
 - Larger-diameter fasteners may be substituted for smaller-diameter fasteners in connectors provided the larger fastener does not cause splitting in the wood member and the connector holes are not enlarged.
 - Simpson Strong-Tie Strong Drive® SD Connector screws are available for use with our connectors. They are designed to replace nails in certain products. See pp. 362–366 for information. Screws not manufactured by Simpson Strong-Tie are not supported in our products.
- b. Fill all fastener holes as specified in the installation instructions for that product. Refer to p. 22 for the requirements of the various shapes of fastener hole.
- c. Do not overdrive nails. Overdriven nails reduce shear capacity. See “Over-Driven Nails in Connectors and Straps” on p. 24 for additional information.
- d. Products shall be installed for the use specified. Use the materials specified in the installation instructions. Substitution of or failure to use specified materials may cause the connection to fail. Do not alter installation procedures from those set forth in this catalog. See Terms and Conditions of Sale.
- e. Do not add fastener holes or otherwise modify Simpson Strong-Tie Company Inc. products. The performance of modified products may be substantially weakened. Simpson Strong-Tie will not warrant or guarantee the performance of such modified products.
- f. The proper use of certain products requires that the product be bent. For those products, installers must not bend the product more than one time (one full cycle).
- g. Bolt holes shall be at least a minimum of $\frac{1}{32}$ " and no more than a maximum of $\frac{1}{16}$ " larger than the bolt diameter (per the 2015/2018 NDS, Section 12.1.3.2 and AISI S100, Table J3, if applicable).
- h. Install all specified fasteners before loading the connection.
- i. Some hardened fasteners may have premature failure if exposed to moisture. These fasteners are recommended to be used in dry interior applications.
- j. Use proper safety equipment.
- k. Welding galvanized steel may produce harmful fumes; follow proper welding procedures and safety precautions. Welding should be in accordance with A.W.S. (American Welding Society) standards. Unless otherwise noted Simpson Strong-Tie connectors cannot be welded.
- l. Pneumatic or power-actuated fasteners may deflect and injure the operator or others. Pneumatic nail tools may be used to install connectors, provided the correct quantity and type of nails (length and diameter) are properly installed in the nail holes. Connectors with tool embossments or tools with nail hole-locating mechanisms should be used. **MASOZ™ mudsill anchor** works with several manufacturers' full round-head pneumatic framing tools. Visit strongtie.com/masoz for additional information. Follow the manufacturer's instructions and use the appropriate safety equipment. Contact Simpson Strong-Tie. Power-actuated fasteners should not be used to install connectors, unless noted otherwise. Reference pp. 173 and 175 for top-flange hanger installation with powder-actuated fasteners.
- m. Joist shall bear completely on the connector seat, and the gap between the joist end and the header shall not exceed $\frac{1}{8}$ " per ICC-ES AC13 test standards (unless specifically noted otherwise).
- n. Fasteners are permitted to be installed through metal truss plates when approved by the Truss Designer in accordance with ANSI/TPI 1-2014, Section 7.5.3.4 and 8.9.2. Installation of Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws through metal connector plates requires the plates to be predrilled using a maximum of a $\frac{5}{32}$ " bit. Do not drive nails through the truss plate on the opposite side of single-ply trusses which could force the plate off the truss.
- o. Nuts shall be installed such that the end of the threaded rod or bolt is at least flush with the top of the nut.
- p. When installing hurricane ties on the inside of the wall special considerations must be taken to prevent condensation on the inside of the completed structure in cold climates.
- q. Unless otherwise noted, connectors shown in this catalog have been designed to be installed at the time the framing members are installed. Contact Simpson Strong-Tie for retrofit suitability of specific connectors including those manufactured in accordance with the hanger options section of this catalog.

Important Information and General Notes

General Instructions for the Designer

These general instructions for the designer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific design and installation instructions and notes provided for each particular product, all of which should be consulted prior to and during the design process.

- a. The term “designer” used throughout this catalog is intended to mean a licensed/certified building design professional, a licensed professional engineer, or a licensed architect.
- b. All connected members and related elements shall be designed by the designer.
- c. All installations should be designed only in accordance with the allowable load values set forth in this catalog.
- d. See p. 12 for allowable load information.
- e. See p. 277 for connections with simultaneous loads.
- f. Loads are based on the 2015/2018 NDS and AISI S100 if applicable, unless otherwise specified. Other code agencies may use different allowable loads.
- g. Unless otherwise noted, loads include Load Duration, Group Action and Toe-Nail factors from the NDS as applicable. The application of additional adjustment factors shall be by the designer. Duration of load adjustments as specified by the code are as follows:
“PERMANENT” — 90% of the design load.
“FLOOR” and “DOWN” (100) — no increase for duration of load.
“SNOW” (115) — 115% of design load for two month duration of load.
“ROOF LOAD” (125) — 125% of design load for seven day duration of load.
“EARTHQUAKE / WIND / UPLIFT” (160) — 160% of design load for earthquake/wind loading.
- h. Unless otherwise noted, wood shear is not considered in the loads given; reduce allowable loads when wood shear is limiting.
- i. Simpson Strong-Tie strongly recommends the following addition to construction drawings and specifications: “Simpson Strong-Tie connectors are specifically required to meet the structural calculations of plan. Before substituting another brand, confirm load capacity based on reliable published testing data or calculations. The Engineer/Designer of Record should evaluate and give written approval for substitution prior to installation.”
- j. Verify that the dimensions of the supporting member are sufficient to receive the specified fasteners, and develop the top flange bearing length.
- k. Some catalog illustrations show connections that could cause cross-grain tension or bending of the wood during loading if not sufficiently reinforced. In this case, mechanical reinforcement should be considered.
- l. The allowable loads published in this catalog are for use when utilizing the traditional Allowable Stress Design methodology. **A method for converting allowable stress design values to Load and Resistance Factor Design (LRFD) is given in the 2015/2018 NDS, Appendix N.** A method for using LRFD for cold-formed steel has also been published in the AISI S100-16. When designing with LRFD, reference lateral resistances must be used. Contact Simpson Strong-Tie for reference lateral resistances of products listed in this catalog.
- m. For joist hangers, Simpson Strong-Tie recommends the hanger height shall be at least 60% of joist height for stability against rotation while under construction prior to sheathing install.
- n. For cold-formed steel applications, as a minimum all screws must comply with Society of Automotive Engineers (SAE) Standard J78, Steel Self-Drilling/Tapping Screws, and must have a Type II coating in accordance with ASTM B 633, Electrodeposited Coatings of Zinc on Iron and Steel. Screw strength shall be calculated in accordance with AISI S100 Section J4, if applicable, or shall be based on the manufacturer’s design capacity determined from testing.
- o. Local and/or regional building codes may require meeting special conditions. Building codes often require special inspection of anchors installed in concrete and masonry. For compliance with these requirements, it is necessary to contact the local and/or regional building authority. Except where mandated by code, Simpson Strong-Tie products do not require special inspection.
- p. Throughout the catalog there are installation drawings showing the load transfer from one element in the structure to another. Additional connections may be required to safely transfer the loads through the structure. It is the designer’s responsibility to specify and detail all necessary connections to ensure that a continuous load path is provided as required by the building code.
- q. Top flange hanger allowable loads are typically based on testing with solid headers. Load reductions may apply when using headers comprised of multiple plies of dimensioned lumber or SCL. See technical bulletin T-C-MPLYHEADR at strongtie.com for more information.
- r. For connections involving members with different specific gravities, use the allowable load corresponding to the lowest specific gravity in the connection, unless noted otherwise.

22	27	1/32	1	0.030	0.033	0.035

1. Use these Roof Pitch to Hip/Valley Rafter Roof Pitch conversion tables only for hip/valley rafters that are skewed 45° right or left. All other skews will cause the slope to change from that listed.

1. Steel thickness may vary according to industry mill standards.

Fastening Identification

Round Holes

Purpose:
To fasten a connector.

Fill Requirements:
Always fill, unless noted otherwise.

Obround Holes

Purpose:
To make fastening a connector in a tight location easier.

Fill Requirements:
Always fill, unless noted otherwise.

Square Holes

Purpose:
To fasten a connector.

Fill Requirements:
Always fill, unless noted otherwise.

Hexagonal Holes

Purpose:
To fasten a connector to concrete or masonry.

Fill Requirements:
Always fill when fastening a connector to concrete or masonry.

Triangular Holes

Purpose:
To increase a connector's strength or to achieve max. strength.

Fill Requirements:
When the designer specifies max. nailing.

Diamond Holes

Purpose:
To temporarily fasten a connector to make installing it easier.

Fill Requirements:
None.

Pilot Holes

Tooling holes for manufacturing purposes. No fasteners required.

Speed Prongs

Used to temporarily position and secure the connector for easier and faster installation.

Positive Angle Nailing (PAN)

Provided when wood splitting may occur, and to speed installation.

Dome Nailing

This feature guides the nail into the joist and header at a 45° angle.

Double-Shear Nailing

The nail is installed into the joist and header, distributing the load through two points on each joist nail for greater strength. Double-shear nailing must be full-length catalog nail.

ITS/IUS Strong-Grip

The Strong-Grip™ seat allows the I-joist to "snap" in securely without the need for joist nails.

Connector Fastener Types

Many Simpson Strong-Tie connectors have been designed and tested for use with specific types and sizes of fasteners. The specified quantity, type and size of fastener must be installed in the correct holes on the connector to achieve published loads. Other factors such as fastener material and finish are also important. Incorrect fastener selection or installation can compromise connector performance and could lead to failure. For more information about fasteners, see our *Fastening Systems* catalog at strongtie.com or access our Fastener Finder [web application](http://web.application) at app.strongtie.com/ff. See pp. 359–363 for connector fastener information.

The Simpson Strong-Tie Strong-Drive® SD Connector screw is the only screw approved for use with our connectors. See pp. 362–366 for more information.

The allowable loads of stainless-steel connectors match those of carbon-steel connectors when installed with Simpson Strong-Tie stainless-steel, SCNR Ring-Shank nails. For more information, refer to engineering letter L-F-SSNAILS at strongtie.com.

Fastener Design Information

In some cases, it is desirable to install Simpson Strong-Tie face-mount joist hangers, post bases and caps, and straight straps with nails that are a different type or size than what is called out in the load table. In these cases, these reduction factors must be applied to the allowable loads listed for the connector.

Load Adjustment Factors for Optional Fasteners Used with Face-Mount Hangers, Post Bases and Caps, and Straight Straps

Connector Table Fastener	Replacement Fastener	Allowable Load Adjustment Factor				
		Face-Mount Hangers			Post Bases and Caps	Straight Straps
		Straight Download/ Uplift	Double Shear			
			Uplift	Download		
0.131" x 1 ½"	#9 x 1 ½" SD Connector screw	1.00	N/A	N/A	N/A	1.00

1. Allowable load adjustment factors shown in the table are applicable to all face-mount hangers, post bases and caps, and straight straps throughout this catalog, except as noted in the footnotes below.
2. Some products have been tested specifically with alternative fasteners and have allowable load adjustment factors or reduced capacities published on the specific product page or strongtie.com. Values published on the product page or strongtie.com may be used in lieu of using this table.
3. This table does not apply to SUR/SUL/HSUR/HSUL/LSU/LSSR™/LSSJ™ hangers or to hangers modified per allowed options, or to connectors made from steel thicker than 10 ga.
4. Strong-Drive® SD Connector screw substitutions in this table do not apply to sloped, skewed, or double-shear hangers. Strong-Drive SD Connector screws may be used in these connectors. For additional information and specific allowable loads, refer to strongtie.com/sd. Where published allowable loads are for installation with #10 SD screws, multiply by 0.83 to obtain allowable loads for #9 SD screws.
5. Nails and Strong-Drive SD Connector screws may not be combined in a connection.
6. Do not substitute 0.148" x 1½" nails for face nails in slope and skew combinations or in skewed-only LSU.
7. For straps installed over ⅝" maximum wood structural panel sheathing, use a 2½"-long fastener minimum.
8. Where noted, use 0.80 for 10 ga., 11 ga., and 12 ga. products when using SPF lumber.
9. Where noted, use 0.92 for 10 ga., 11 ga., and 12 ga. products when using SPF lumber.
10. Where noted, 1½"-long fasteners may be substituted for the specified fastener into the header only; double-shear fasteners shall be minimum 2½" long.

For LUS, MUS, HUS, LRU, HHUS and HGUS™ Hangers

Double-shear nailing shall use minimum 2½"-long nails or 2½"-long SD screws

Shorter fasteners may not be used as double-shear nails

Over-Driven Nails in Connectors and Straps

A nail that is installed such that the head deforms the steel of the connector or strap is considered over-driven. Extra care to prevent over-driven nails should be taken when installing power-driven nails. Simpson Strong-Tie has evaluated the effect of over-driven nails in connectors and straps. No load reductions for connectors or straps apply as a result of over-driven nails if all of the following conditions are met:

- Connectors and straps are 14-, 16-, or 18-gauge steel.
- The top of the nail head is not driven past flush with the face of the metal hardware.
- The nail goes through an existing fastener hole without enlarging it.
- The steel around the hole is not torn or damaged other than denting caused by the nail head.

Sill Plate Anchoring Solutions

Simpson Strong-Tie offers many anchorage solutions for sill plate applications in concrete or concrete block foundations. Cast-in-place structural connectors offer a time-saving alternative to anchor bolts, and provide installers with more flexibility on the jobsite. Our post-installed connectors are often used in retrofit/expansion applications or when cast-in place anchors are omitted or mis-located. All of these connectors have been evaluated and are acceptable alternates to the code-specified anchor bolts. Powder-actuated pins are acceptable alternates to code-specified anchor bolts for temporary placement of exterior sill plates and for permanent attachment of interior sill plates.

Various product finishes are available to address most environmental or preservative-treated wood conditions. For more information on product performance, installation requirements, corrosion and appropriate code listings for Simpson Strong-Tie products, please visit strongtie.com. For a complete listing of code-compliant sill plate anchorage solutions, see technical bulletin T-A-SILPLANCH at strongtie.com.

URFP™/FRFP™**Retrofit Foundation Plates**

Ideal where there is minimum vertical clearance, the URFP universal retrofit foundation plate provides a retrofit method to secure the mudsill to the foundation. This design allows installation flexibility when the mudsill is offset or inset from the foundation edge. With its combination of longitudinal embossments, stiffening darts and scalloped slotted holes, the URFP allows for a one-for-one replacement of ½" or ⅝" mudsill anchors as well as fixity to both the SDS screws and required concrete anchorage.

The FRFP flat retrofit foundation plate connects the mudsill to the foundation and provides lateral load resistance. This design allows the designer to maintain prescriptive requirements when filling three holes, or as an alternate, fill the two optional triangle holes and designers can utilize increased loads and greater allowable spacing.

Material: URFP — 14 gauge; FRFP — 7 gauge

Finish: Galvanized. May be ordered HDG.

Installation:

- Use all specified fasteners; see General Notes.
- Install URFP using ¼" x 3" Strong-Drive® SDS Heavy-Duty Connector screws, which are supplied with the URFP.
- For URFP, alternate lag screws will not achieve published loads.
- FRFP shall use a minimum Strong-Drive SDS Heavy-Duty Connector screw length of 2½" plus the shim thickness. Follow code requirements for predrilling. Fasteners are sold separately.
- For additional retrofit information, see strongtie.com.

Codes: See p. 13 for Code Reference Key Chart

Typical URFP Installation for Three Foundation Types (End View)

URFP Installed on a Straight Foundation with ½" Offset Mudsill

Typical FRFP Installation Foundation to Mudsill

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Fasteners			DF/SP Allowable Loads (160)		Code Ref.
	Anchor Bolt		Sill Plate	F ₁	F ₂	
	Qty.	Dia.				
URFP	2	½"	(5) ¼" x 3" SDS	1,530	—	IBC®, FL, LA
FRFP	2	½"	(3) ¼" x 2½" SDS + shim thickness	1,065	320	
	2	½"	(5) ¼" x 2½" SDS + shim thickness	1,810	320	

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Each anchor bolt requires a standard-cut washer. The Simpson Strong-Tie Titen HD® heavy-duty screw anchor does not require a washer.
3. Nominal embedment depth for post-installed anchors into concrete must be 4" for SET-3G™, ET-3G™ or AT-3G™, or use ½" x 4" Titen HD screw anchors. Anchorage into CMU is per designer.
4. For redwood mudsills, reduce F₁ on FRFP to 820 lb. (1,395 lb. for five screws) and on URFP to 1,180 lb.
5. For installation on SPF/HF sill plates, use 0.86 x DF/SP allowable load.

Prescriptive Spacing for URFP and FRFP to Replace Sill Anchor Bolts

Number of Building Stories	Anchor Bolt Size	Anchor Bolt Spacing	Retrofit Foundation Anchor Model		
			URFP	FRFP with Three Fasteners	FRFP with Five Fasteners
One story	½" dia.	6' o.c.	6'	6'	6'
	⅝" dia.	6' o.c.	6'	4'–3"	6'
Two stories	½" dia.	4' o.c.	4'	4'	4'
	⅝" dia.	6' o.c.	6'	4'–3"	6'
Three stories	⅝" dia.	4' o.c.	4'	2'–10"	4'

1. "Prescriptive" denotes spacing requirements per the IBC and designs per the IRC and conventional provisions of the IBC.
2. For design in accordance with the IBC Chapter A3, the URFP may be used as a one-for-one replacement for the alternative connections shown in Figures A304.3.1(2), A304.3.1(3) and A304.3.1(4).
3. Spacing is based on the parallel-to-plate load direction.
4. ⅝" anchor bolt required for Seismic Design Category E.

FJA/FSA

Foundation Anchors

The FJA foundation joist anchor nails or bolts directly into floor joists, providing a direct connection between the foundation and joist to resist uplift and lateral forces.

The FSA foundation stud anchor nails or bolts to floor joists, or nails to the stud. Plywood sheathing may require notching with stud-to-foundation installation.

Material: 12 gauge

Finish: Galvanized. May be ordered HDG.

Installation:

- Use all specified fasteners; see General Notes.
- FJA and FSA may be bent along bend line up to 20° to accommodate installation. Bend one time only.

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Fasteners			DF/SP Allowable Loads (160)			Code Ref.
	Anchor Bolt		Stud / Joist / Plate	Uplift	F ₁	F ₂	
	Qty.	Dia.					
FJA	2	½"	(8) 0.148 x 1 ½	1,250	205	55	IBC®, FL, LA
			(2) ½" bolt	710	205	55	
FSA	2	½"	(8) 0.148 x 1 ½	1,250	—	—	
			(2) ½" bolt	710	—	—	

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Spacing to be specified by the designer.
3. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal or better than ASTM A307, Grade A.
4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical FSA Installation
Foundation to Stud

FWANZ**Foundation Wall Angles**

The FWANZ foundation anchor connects the foundation or basement wall to the floor system to resist out-of-plane forces imposed by soil pressure. The foundation wall angle fastens to the mudsill with nails, relying on other anchorage (by designer) to anchor the sill plate to the foundation.

Special Features:

- Compatible with solid sawn joists, I-joists and floor trusses
- Testing performed on most common rim materials and types
- Addresses design needs set forth in Section 1610.1 in the 2015/2018/2021 IBC®
- Eliminates the need of costly cantilevered foundation designs

Material: 14 gauge

Finish: ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes.
- Connector must be fastened directly to the outside face of the rim board with (5) 0.148" x 1 1/2" long nails.
- Connector must be located within 4" of adjacent joist/blocking for floor joist spacing up to 48" o.c. and may be centered between joists/blocking for 16" o.c. floor joist spacing.
- When floor joists are parallel to the rim board, full depth blocking shall be used in the first two bays of the floor.
- Splice joint not permitted on rim board in same bay unless blocking is placed on both sides of the splice.
- When I-joist rim material is used, backer blocks must be used. Installed per manufacturer's recommendations.

Codes: See p. 13 for Code Reference Key Chart; refer to IBC 1610.1

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Sill Plate	Fastener (in.) (Quantity) Type		Rim Board Material	Allowable F ₂ Load (DF/SP Sill Plate)			Allowable F ₂ Load (HF Sill Plate)			Code Ref.

				1 1/8" OSB rim	815	815	815	815	815	815	
				1 3/4" I-joist rim	940	1,045	1,070	815	905	1,070	
				1 1/4" LSL rim	940	1,045	1,105	815	905	1,105	
				2x rim	940	1,045	1,390	815	905	1,345	
				1 3/4" LVL rim	940	1,045	1,245	815	905	1,245	
	2x6, (2) 2x6, 3x6, 4x6	(11) 0.148 x 1 1/2	(5) 0.148 x 1 1/2	1" OSB rim	750	750	750	750	750	750	
				1 1/8" OSB rim	935	935	935	935	935	935	
				1 3/4" I-joist rim	955	955	955	955	955	955	
				1 1/4" LSL rim	1,025	1,025	1,025	1,025	1,025	1,025	
				2x rim	1,295	1,440	1,445	1,120	1,245	1,445	
				1 3/4" LVL rim	1,295	1,385	1,385	1,120	1,245	1,385	

1. FWANZ may be used to transfer F₁ loads up to 260 lb. No further increase in load permitted.
2. For simultaneous loads in more than one direction, the connector must be evaluated using the Unity Equation, as described in [Straps and Ties General Notes](#), p. 277.
3. Designer shall evaluate rim board and sill plate design based on demand load.
4. FWANZ spacing and sill plate anchorage are to be specified by the designer.
5. When floor joists are parallel to the rim board, designer must ensure proper load transfer from the rim board into the diaphragm.
6. Values are based on a load duration factor of C_D = 0.90.
7. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

WT

Wedge Form Tie

The wedge tie (WT) is a form tie that secures concrete forms in place while the concrete is poured. It easily installs between form boards and accurately spaces the forms. Several models are available for varying wall thickness and types of form boards.

Designed for low foundation wall applications. $\frac{5}{8}$ "-wide formed "V" design for rigidity allows accurate form spacing and support. Sizes now available for composite form board.

Material: W1 — 14 gauge; WT — 18 gauge

Finish: Galvanized

Installation:

- Two W1 wedges are required for each wedge tie
- Not recommended for wall pours greater than 4' high
- Wall thickness from 6" to 12"

Order wedges separately.
Specify W1.

The spacing of the WTs along the length of the form depends on the depth of the WT in the form. The spacing does not depend on the thickness of the wall. The maximum recommended spacing for WTs used with 1x, 2x and 1 1/4" thick forms is outlined in the tables below. The tables give spacing guidelines for various form heights and types of form boards. In general, the higher the form is, the closer the spacing of the WTs should be.

MASA/MASAP

Mudsill Anchors

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

Mudsill anchors have always been a time-saving alternative to anchor bolts, and the MASA anchors provide a great alternative for $\frac{5}{8}$ " and $\frac{1}{2}$ " mudsill anchor bolts on 2x, double-2x and 3x mudsills. It also eliminates the need for 3" square plate washers for seismic design and, in some cases, has allowable loads that meet or exceed the parallel- and perpendicular-to-plate shear loads of other cast-in-place anchors. Two versions of the MASA are available — the standard MASA for installation on standard forms and the MASAP for panelized forms.

The MASA and MASAP are code listed by ICC-ES under the 2012, 2015, 2018 and 2021 IBC® and IRC®.

Material: 16 gauge

Finish: Galvanized. Also available in ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes.
- Concrete shall have a minimum $f'_c = 2,500$ psi.
- Spalling — Full loads apply for spalls up to a maximum height of $1\frac{1}{4}$ " and a maximum depth of $\frac{7}{8}$ ". Any exposed portion of the mudsill anchor must be protected against possible corrosion.
- For prescriptive anchor spacing refer to table below.
- Testing shows that these mudsill anchors can be used in lieu of code-required anchor bolts and square washer in high seismic zones.
- Minimum MASA end distance is 4" and minimum center-to-center spacing is 8" for full load. For reduced center-to-center spacing and/or end distance, see engineering letter L-C-MASASPCNG on strongtie.com.
- For continuous load path, MASA should be installed on the same side of wall as uplift connectors.
- For installation in severe corrosion environments, refer to strongtie.com/cipcorrosion for additional considerations.

Codes: See p. 13 for Code Reference Key Chart

Prescriptive Spacing for MASA/MASAP to Replace Sill Anchor Bolts

Model No.	Anchor Bolt Size to Replace	Anchor Bolt Spacing to Replace	MASA/MASAP Spacing			
			DF/SP 2x Sill Plate		HF 2x Sill Plate	
			Wind and SDC A&B	SDC C-E	Wind and SDC A&B	SDC C-E
MASA MASAP	$\frac{1}{2}$ " diameter	6' o.c.	6'-0"	6'-0"	6'-0"	6'-0"
		4' o.c.	4'-0"	4'-0"	4'-0"	4'-0"
MASA MASAP	$\frac{5}{8}$ " diameter	6' o.c.	5'-4"	4'-6"	5'-1"	4'-4"
		4' o.c.	3'-6"	3'-1"	3'-5"	2'-11"

1. Detached one- and two-family dwellings in SDC C may use the "Wind and SDC A&B" spacing.
2. Spacing is based on the parallel-to-plate load direction for MASA standard installation only.
3. $\frac{5}{8}$ " anchor bolt required for Seismic Design Category E.
4. When replacing $\frac{1}{2}$ "-diameter sill bolts, use (7) 0.148" x $1\frac{1}{2}$ " nails for standard installation.
One out of three MASA anchors (33%) may be installed in one-leg-up installation along a wall line.
5. When replacing $\frac{5}{8}$ "-diameter sill bolts, use (9) 0.148" x $1\frac{1}{2}$ " nails for standard installation.
One out of five MASA anchors (20%) may be installed in one-leg-up installation along a wall line.
6. Per Section 1613 of the 2012/2015/2018/2021 IBC, detached one- and two-family dwellings in SDC C may use the "Wind and SDC A&B" spacing.

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.

2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.

3. Allowable loads are based on a minimum stem wall width of 6".

4. For simultaneous loads in more than one direction, the connector must be evaluated using the Unity Equation, as described in

[Straps and Ties General Notes, p. 277](#).

5. Per Section 1613 of the 2012/2015/2018/2021 IBC, detached one- and two-family dwellings in SDC C may use the "Wind and SDC A&B" allowable loads.

6. For designs under the 2012/2015/2018/2021 IBC, sill plate size shall comply with the shearwall requirements of the 2015/2021 Special Design Provisions for Wind and Seismic.

7. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Alternative Mudsill Anchor Installations

Alternate Installation for Inside of Wall Continuity

Full catalog loads apply.

- 1 Step 1:** Attach MASA 3 1/2" from inside of form. After concrete cures, remove nails and bend straps up 90°.

- 2 Step 2:** Place mudsill on concrete and nail MASA over mudsill. Not applicable to 2x6 and wider sill plates in SDC D-F.

Alternate Installation for Brick Ledges

Full catalog loads apply.

Alternate MASA Installation for Brick Ledges

Alternate Installation for Rim Board or Blocking

Blocking required attached to sill with A35Z (not shown) or per designer

Maximum 1/2" Sheathing

MASOZ™/MASOPZ™

Mudsill Anchors

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The latest in our growing line of offsite construction solutions, the MASOZ is an ideal mudsill anchor for factory-built, sheathed wall panels. The connector provides an effective anchorage method that reduces onsite labor costs. It provides a convenient alternative to traditional cast-in-place anchors by eliminating the need to make field adjustments for misaligned anchors. In addition, compared to post-installed anchors, significant time is saved by removing the need to drill and set anchors after the wall panels are placed. The MASOZ also eliminates the need for additional blocking and connectors required by our MASA product when used over sheathing. Two versions of the MASOZ are available — the standard MASOZ for installation on standard form boards, and the MASOPZ for panelized forms.

Material: 16 gauge

Finish: ZMAX® coating

Loads: Loads not available at time of printing. See strongtie.com for the allowable load table.

Installation:

- Use all specified fasteners; see General Notes.
- Concrete shall have a minimum $f'_c = 2,500$ psi. Use a concrete vibrator or other means to ensure full consolidation of concrete around the part.
- The MASOZ is designed to be attached through wood structural panel sheathing. For direct attachment to the sill plate, use MASA.
- Spalling — full loads apply for spalls up to a maximum height of 1" and a maximum depth of $\frac{5}{8}$ ". Any exposed portion of the mudsill anchor must be protected against possible corrosion.
- Minimum MASOZ end distance is 6" and minimum center-to-center spacing is 12" for full load. For reduced center-to-center spacing and/or end distance, contact Simpson Strong-Tie for reduced loads.
- For continuous load path, uplift connectors should be installed on the same side of the wall as the MASOZ.
- For installation in severe corrosion environments, refer to strongtie.com/cipcorrosion for additional considerations.

LMAZ/MAB/MASB

Mudsill Anchors

Mudsill anchors provide an alternative to anchor bolts. They easily mount on forms and make finishing easier. The unique design provides installation flexibility, eliminating problems with misplaced anchor bolts. Suitable for stemwall or slab foundations, mudsill anchors are one piece so there are no more nuts and washers to lose.

LMAZ — anchors mudsill to poured walls or slab foundations

MAB — anchors mudsill to concrete block, poured walls or slab foundations

MASB — anchors mudsill to concrete block

Material: LMAZ, MAB — 18 gauge; MASB — 16 gauge

Finish: MAB, MASB — galvanized (also available in ZMAX® coating); LMAZ — ZMAX only.

Installation:

- Use all specified fasteners; see General Notes.
- **LMAZ/MAB:**
 - CMU shall have a minimum $f'_m = 1,500$ psi and concrete shall have a minimum $f'_c = 2,500$ psi.
 - Not for use where a horizontal cold joint exists between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load.
 - Not for use in slabs poured over foundation walls formed of concrete block or with brick and 4" masonry block stemwalls.
- **MASB**
 - Fill CMU cell with concrete grout first, then place MASB into the grouted cell and adjust into position. Attach mudsill to anchor only after the concrete grout cures.
 - CMU shall have a minimum $f'_m = 1,500$ psi.
 - The MASB mudsill anchors were tested in standard 8" CMU.

	2x8, 2x10, 2x12	(2) 0.148 x 1 1/2	(4) 0.148 x 1 1/2	—	500	500	

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.

2. For uplift loads, provide attachment from mudsill to building's structural components to prevent cross-grain bending.

3. LMAZ installed attached to the stud has no load reduction for parallel and perpendicular loads and an uplift of 600 lb. for LMA4 and 835 lb. for LMA6.

4. For concrete stem wall applications, allowable loads are based on a minimum concrete stem wall width of 6".

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

LMAZ/MAB/MASB

Mudsill Anchors (cont.)

These products are available with additional corrosion protection. For more information, see p. 16.

Prescriptive Anchor Spacing

Model No.	O.C. Spacing to Replace ½" Anchor Bolt 6' O.C. (160)	O.C. Spacing to Replace ⅝" Anchor Bolt 6' O.C. (160)	Minimum Concrete End Distance	Minimum C-C Spacing
MASB	5'-0"	3'-5"	3¾"	7½"
LMA4Z	3'-8"	2'-7"	4⅝"	9¼"
LMA6Z	4'-6"	3'-2"		
MAB15	3'-10"	2'-8"	6½"	13"

1. "Prescriptive" denotes designs per the IRC® or conventional provisions of the IBC® for wind speeds 140 mph or less, or for Seismic Design Category D and less (SDC E and less in IBC).
2. Spacing is based on parallel-to-plate load direction only.
3. Place anchors not more than 12" from the end of sill and splices per code.
4. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
5. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
6. Spacings apply to DF, SP, and HF sill plates.
7. For concrete stemwall applications, the minimum concrete stemwall width is 6".

SB

Anchor Bolt

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The SB anchor bolt offers an anchorage solution for our holdowns that call for a 5/8"-diameter, a 7/8"-diameter and a 1"-diameter anchor.

SB anchor bolts are code listed by ICC-ES under the 2012/2015/2018/2021 IBC® and IRC®.

Features:

- Identification on the bolt head showing embedment angle and model
- Sweep geometry to optimize position in form
- Rolled thread for higher tensile capacity
- Hex nuts and plate washer fixed in position
- Available in HDG for additional corrosion resistance

Material: ASTM F1554, Grade 36

Finish: None. May be ordered HDG.

Installation:

- SB is only for concrete applications poured monolithically except where noted.
- Top nuts and washers for holdown attachment are not supplied with the SB; install standard nuts, couplers and/or washers as required.
- On HDG SB anchors, chase the threads to use standard nuts or couplers or use overtapped products in accordance with ASTM A563, for example Simpson Strong-Tie NUT $\frac{5}{8}$ -OST, NUT $\frac{7}{8}$ -OST and NUT1-OST, CNW $\frac{5}{8}$ -OST, CNW $\frac{7}{8}$ -OST and CNW1-OST.
- Install SB before the concrete pour using AnchorMate® anchor bolt holders (see p. 42). Install the SB per the plan view detail.
- Minimum concrete compressive strength is 2,500 psi.
- When rebar is required it does not need to be tied to the SB.

Codes: See p. 13 for Code Reference Key Chart

SB1X30	8	1	30	24	13,110	9,505	6,930	11,470	8,315	6,065	

1. Rebar is required at the top of stem wall foundations, but is not required for slab-on-grade edge and garage curb, or stem wall garage front installations.
2. Minimum end distances for SB bolts are as shown in graphics.
3. To obtain LRFD values, multiply ASD seismic load values by 1.43 and wind load values by 1.67.
4. Per Section 1613 of the IBC, detached one- and two-story dwellings in SDC C may use "Wind and SDC A&B" allowable loads.
5. Midwall loads apply when anchor is 1.5 le or greater from the end. For bolts acting in tension simultaneously, the minimum bolt center-to-center spacing is 3 le.
6. Full catalog loads apply for two-pour installation for slab on grade: edge.

The Simpson Strong-Tie Post-to-Foundation Designer offers a quick way to specify a holdown and the applicable anchorage to meet your project design requirements. Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

Anchor Bolt

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The SSTB anchor bolt is designed for maximum performance as an anchor bolt for holdowns and Simpson Strong-Tie Strong-Wall® shearwalls. Extensive testing has been done to determine the design load capacity of the SSTB when installed in many common applications. The Simpson Strong-Tie SSTB anchor bolts are code listed by ICC-ES under the 2012, 2015, 2018 and 2021 IBC® and IRC®.

Features:

- Identification on the bolt head showing embedment angle and model
- Offset angle reduces side bursting, and provides more concrete cover
- Rolled thread for higher tensile capacity
- Stamped embedment line aids installation
- Available in HDG for additional corrosion resistance

Material: ASTM F-1554, Grade 36

Finish: None. May be ordered HDG.

Installation:

- SSTB is suitable for monolithic and two-pour concrete applications.
- Nuts and washers for holdown attachment are not supplied with the SSTB; install standard nuts, couplers and/or washers as required.
- On HDG SSTB anchors, chase the threads to use standard nuts or couplers or use overlapped products in accordance with ASTM A563, for example Simpson Strong-Tie NUT $\frac{3}{8}$ -OST, NUT $\frac{3}{8}$ -OST, CNW $\frac{3}{8}$ -OST, CNW $\frac{3}{8}$ -OST.
- Install SSTB before the concrete pour using AnchorMate® anchor bolt holders (see p. 38). Install the SSTB per the plan view detail.
- Minimum concrete compressive strength is 2,500 psi.
- When rebar is required it does not need to be tied to the SSTB.
- Order SSTBL models (example: SSTB16L) for longer thread length (16L = 5½", 20L = 6½", 24L = 6", 28L = 6½"). SSTB and SSTBL load values are the same. SSTB34 and SSTB36 feature 4½" and 6½" of thread respectively and are not available in "L" versions.

GFCMU (Grout-Filled Concrete Masonry Units)

- One horizontal #4 rebar in the second course.
- One vertical #4 rebar in adjacent cell for ½"-diameter SSTB.
- One vertical #4 rebar in an adjacent cell and additional vertical #4 rebar(s) at 24" o.c. max. for ¾"-diameter SSTBs (2 total vertical rebars for end wall corner, 3 total vertical rebars for midwall).

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

Typical SSTB Installation in Concrete Foundation

Maintain minimum rebar cover, per ACI-318 concrete code requirements

Two-Pour Installation (SSTB20, 24, 34 and 36)

Plan View of SSTB Placement in Concrete and GFCMU

For two-pour (4" slab) installation loads:

- When using the SSTB20, use the equivalent loads of the SSTB16.
- When using the SSTB24, use the equivalent loads of the SSTB20.
- When using the SSTB34 or 36, use the equivalent loads of the SSTB28.

SSTB36	$\frac{7}{8}$	36 $\frac{1}{2}$	28 $\frac{1}{2}$	4,185	3,000	

1. Loads are based on a minimum CMU compressive strength, f'_m , of 1,500 psi.
2. Minimum end distance required to achieve midwall table loads is $1.5 l_e$.
3. Minimum end distance for corner/end wall loads is $4\frac{1}{4}$ ".
4. Loads may not be increased for duration of load.
5. Allowable loads are based on the average ultimate load with a safety factor of 5.0 per TMS 402.

Typical SSTB Installation
in Grout-Filled Concrete Block

AnchorMate®

Anchor Bolt Holder

The reusable AnchorMate (AM) anchor bolt holder is designed to hold the anchor in place before the concrete pour, as required in some jurisdictions. The gripping section secures the bolt in place without a nut for quicker setup and teardown. It also protects the threads from wet concrete and simplifies trowel finishing.

Features:

- Built-in 2x4 and 2x6 stops eliminate measuring.
- Color coded for easy size identification.
- Use the AnchorMate to secure the SSTB®/SB anchors to the form board before the concrete pour. Alignment arrows (left or right) match the SSTB/SB bolt head arrow.

Material: Engineered composite polymer

Model No.	Diameter (in.)	Color
AM1/2	1/2	Yellow
AM5/8	5/8	Blue
AM3/4	3/4	Red
AM7/8	7/8	Green
AM1	1	Black

AnchorMate
Anchor Bolt Holder

Typical AnchorMate
Installation for a 2x6 Mudsill

Typical AnchorMate
Installation for a 2x4 Mudsill

ABS

Anchor Bolt Stabilizer

The ABS stabilizes the anchor bolt to prevent it from being pushed against the form during the concrete pour.

Features:

- Supports the bolt approximately 8" below the top of the concrete
- Model ABS5/8 is for the 5/8" SSTB and ABS7/8 is for the 7/8" SSTB
- Thin section limits the effect of a cold joint
- Sized for 2x4 and 2x6 mudsills

Material: Engineered composite polymer

Model No.	Diameter (in.)	Color
ABS5/8	5/8	Blue
ABS7/8	7/8	Green

SAR

Shallow Anchor Rod

SAR anchor rods are for use with the ABL anchor bolt locator. They combine to make an economical podium-deck anchorage solution. Anchorage specification is per designer.

Features:

- Proprietary, preattached plate washer
- Available in standard or high strength
- Anchor rod diameters from ½" to 1 ¼"
- Standard lengths available 18", 24", 30" or 36"
- Specify "HDG" for hot-dip galvanized

Reference the Shallow Anchor Solutions details for more information.

Visit strongtie.com/sardetails.

ABL

Anchor Bolt Locator

The ABL enables the accurate and secure placement of anchor bolts on concrete-deck forms prior to concrete placement. The structural heavy-hex nut is attached to a preformed steel "chair," which eliminates the need for an additional nut on the bottom of the anchor bolt. Electrogalvanized versions available for HDG anchor bolts. Order ABL-OST when using HDG anchor bolts.

Features:

- Designed for optimum concrete flow.
- Installed with (2) nails or (2) screws.
- Meets code requirement for 1" stand off.
- The ABL is designed for use with SAR anchors.

Material: Chair — 14 gauge

Finish: Nut — none or electrogalvanized; chair — G90

Model No.	Anchor Bolt Diameter (in.)
ABL4-1	½
ABL5-1	⅝
ABL6-1	¾
ABL7-1	7/8
ABL8-1	1
ABL9-1	1 ⅛
ABL10-1	1 ¼

ABL

US Patents 8,621,816 and 8,381,482

Shallow Podium Slab

Anchor Kit

The Shallow Podium Slab anchor kit includes the patented Anchor Bolt Locator (ABL) and patent-pending Shallow Anchor Rod (SAR). Uniquely suited for installation to concrete-deck forms, the ABL enables accurate and secure placement of anchor bolts. The structural heavy hex nut is attached to a preformed steel "chair" and becomes the bottom nut of the anchor assembly. The shallow anchor is provided with a plate washer fixed in place that attaches on the ABL nut when assembled and increases the anchor breakout and pullout capacity. The shallow anchor is easily installed before or after placement of the slab reinforcing steel or tendons. Where higher anchor capacities are needed such as at edge conditions or to meet seismic ductility requirements, the anchor kit is combined with anchor reinforcement.

Shallow Podium Slab Anchor Kit

Naming Legend

SA1OST-8H-18KT

- Shallow Anchor
- Standoff (1 for 1" cover)
- Oversize Threads (When hot-dip galvanized anchors are specified)
- High Strength
- Rod Diameter in ⅛" Increments (Ex: 8 = ⅝" or 1")
- Kit (includes ABL and SAR)
- Length (18", 24", 30", 36")

PAB™

Pre-Assembled Anchor Bolt

The PAB anchor bolt is a versatile cast-in-place anchor bolt ideal for high-tension-load applications, such as rod systems and shearwalls. It features a plate washer, at the embedded end, sandwiched between two fixed hex nuts and a head stamp for easy identification after the pour.

- Available in diameters from ½" to 1¼" in lengths from 12" to 36" (in 6" increments)
- Available in standard and high-strength steel
- Head stamp contains the No Equal sign, diameter designation and an "H" on high-strength rods

Material:

Standard Steel — ASTM F1554 Grade 36, A36 or A307; $F_u = 58$ ksi

High-Strength Steel (up to 1" dia.) — ASTM A449; $F_u = 120$ ksi

High-Strength Steel (1½" and 1¼" dia.) — ASTM A193 B7 or F1554 Grade 105; $F_u = 125$ ksi

Finish: None. May be ordered in HDG.

Installation:

- On HDG PABs, chase the threads to use standard nuts or couplers or use overlapped products in accordance with ASTM A563; for example, Simpson Strong-Tie NUT½-OST, NUT¾-OST, CNW¾-OST, CNW7/8-OST. OST couplers are typically oversized on one end of the coupler nut only and will be marked with an "O" on oversized side. Couplers may be special ordered with both ends oversized. Contact Simpson Strong-Tie.

Related Software and Web Applications:

- The Simpson Strong-Tie Anchor Designer™ Software analyzes and suggests anchor solutions using the ACI 318 strength-design methodology (or CAN/CSA A23.3 Annex D Limit States Design methodology). It provides cracked and uncracked-concrete anchorage solutions for numerous Simpson Strong-Tie mechanical and adhesive anchors as well as the PAB anchor bolt. With its easy-to-use graphical user interface, the software makes it easy for the designer to identify anchorage solutions without having to perform time-consuming calculations by hand. Visit app.strongtie.com/adc to access our Anchor Designer Software.

- The Simpson Strong-Tie Post-to-Foundation Designer allows you to easily design holdowns and anchors that resist uplift loads per latest building codes. Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

How to Specify and Order:

- When calling out PAB anchor bolts, substitute the desired length for the "XX" in the Root Model Number
- For a ⅝" x 18" anchor bolt, the model number would be PAB5-18 (or PAB5H-18 for high strength)

PAB Anchor Bolt

Diameter (in.)	Plate Washer Size (in.)	l ₁ (in.)	Root Model No.		Lengths (in.)
			Standard Strength	High Strength	
½	⅝ x 1½ x 1½	1½	PAB4—XX	PAB4H—XX	12" to 36" (in 6" increments)
⅝	½ x 1¾ x 1¾	1¾	PAB5—XX	PAB5H—XX	
¾	½ x 2¼ x 2¼	1½	PAB6—XX	PAB6H—XX	
7/8	½ x 2½ x 2½	1¾	PAB7—XX	PAB7H—XX	
1	⅝ x 3 x 2¾	1¾	PAB8—XX	PAB8H—XX	
1½	⅝ x 3½ x 3¼	2	PAB9—XX	PAB9H—XX	
1¼	¾ x 3½ x 3½	2¼	PAB10—XX	PAB10H—XX	

1. Lengths greater than 36" are available as a special order.

2. Plate washers are designed to develop the capacity of the bolt.

**Naming Legend**

PAB5H-12

PAB Anchor Bolt Diameter* and Grade Length (12", 18", 24", 30" or 36")

*Units in ⅛" Increments
(Ex: 9 = ⅝" or 1½")

Design loads are calculated using a full shear cone. Coverage on each side of the bolt shall be a minimum of F or reductions must be taken.

			15	22½	26,690	40,035	14½	22	26,690	40,035

1. Anchorage designs conform to ACI 318-14 and assume cracked concrete with no supplementary reinforcement.

2. Seismic indicates Seismic Design Category C-F and designs comply with [ACI 318-19, Section 17.10.5.3](#).

Per Section 1613 of the 2012/2015/2018/2021 IBC®, detached one- and two-family dwellings in SDC C may use wind values.

3. Wind includes Seismic Design Category A and B.

4. Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by designer. The registered design professional may specify alternative embedment, footing size, and anchor bolt.

5. Where tension loads are governed by anchor steel, the design provisions from AISC 360 are used to determine the tensile steel limit. LRFD values are calculated by multiplying the nominal AISC steel capacity by a 0.75 phi factor, and allowable values are calculated by dividing the AISC nominal capacity by a 2.0 omega factor.

6. Where tension loads are governed by ACI 318 concrete limit, the Allowable Stress Design (ASD) values are obtained by multiplying Load Resistance Factor Design (LRFD) capacities by 0.7 for seismic and by 0.6 for wind.

Holdown Anchorage Solutions

The anchor bolt solutions in Table 1 (DF/SP Lumber) and Table 2 (SPF/HF Lumber) provide anchorage solutions for the holdown sizes listed. Unless noted otherwise, the solutions meet the maximum published allowable load of the holdown. Refer to pp. 35–37 for SB anchor bolt installation details, pp. 38–41 for SSTB® anchor bolts installation details, and p. 44 for PAB anchor bolt details.

The Simpson Strong-Tie Post-to-Foundation Designer offers a quick way to specify a holdown and the applicable anchorage to meet your project requirements. Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

Anchorage solutions marked with an asterisk () are within 5% of the holdown's maximum allowable load.

The load in parenthesis is the allowable load of the anchor bolt.

- Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by designer. The registered design professional may specify alternative embedment, footing size, and anchor bolt.
- Minimum edge distance is 1 1/4". Minimum end distance is 5" for SSTBs and the SB1x30; 4 1/4" for SB5/8x24 and SB7/8x24.
- PAB7 anchor bolts require $d_e = 10"$ with $F = 15"$. PAB8 anchor bolts require $d_e = 12"$ with $F = 18"$. Anchorage design conforms to ACI 318 and assumes $f'_c = 2,500$ psi cracked concrete with no supplementary reinforcement, with seismic design conforming to ACI 318-19, Section 17.10.5.3. CNW7/8 and CNW1 available for cases where a longer anchor bolt is required. Select bolt length based on foundation configuration to meet the required footing embedment.
- Where noted, SB1x30 requires footing width to be 18" wide. PAB8 solution may also be used.
- Per Section 1613 of the IBC®, detached one- and two-family dwellings in SDC C may use Wind and Seismic Design Category A&B values.
- PAB anchorage capacity is based on footing dimensions as shown in table on p. 45. See illustration for PAB installed in a footing on p. 44. For stemwall installations, PAB must be embedded into the footing.

Slab-on-Grade Installation (H DU14, H HDQ14 and H D12)

BP/LBP/RP6

Bearing Plates

Bearing plates give greater bearing surface than standard cut washers, and help distribute the load at these critical connections.

The BP1/2-3 and BP5/8-3 are 3" x 3" bearing plates that meet the latest requirements of the IRC® and IBC®. These plate washers are available uncoated or with a hot-dip galvanized (HDG) coating.

The BPS and LBPS are bearing plates that offer increased flexibility while meeting the latest requirements of the code for 2x4 and 2x6 walls. The slotted hole allows for adjustability to account for bolts that are not in the middle of the sill plate.

The BP5/8SKT uses 1/4" x 1 1/2" Strong-Drive® SDS Heavy-Duty Connector screws to provide lateral resistance when 5/8" diameter sill holes are overdrilled (screws are provided). The shear capacity of the connection and the sill/anchor bolt shall be determined by the designer for each installation.

The RP6 retrofit plate is installed on the outside of masonry buildings and helps tie the walls to the roof or floor structure with a 3/4"-diameter rod.

Material: See table

Finish: LBP, LBPS — galvanized; BP7/8-2, BP5/8S — zinc plated; BPS, BP — none; RP6 — Simpson Strong-Tie gray paint. BPs, BPSs and RP6 may be ordered HDG; LBP and LBPS products may be ordered ZMAX®. BPs available in black powder coat; add PC to model number.

Installation:

- See General Notes.
- BP/BPS — For shearwall applications, position edge of plate washer within 1/2" of sheathed edge of sill plate.
- BPS-6 plate washers are sized to accommodate the 1/2" from the sheathed edge in single- and double-sheathed 2x6 walls.
- Standard-cut washer required with BPS slotted bearing plates. Washer not required when used with Titen HD® heavy-duty screw anchors.

Codes: See p. 13 for Code Reference Key Chart; 2012/2015/2018/2021 IRC R602.11.1, 2015/2021 SDPWS 4.3.6.4.3

Your Resource for URM Building Retrofit

Unreinforced masonry (URM) construction was commonplace from the 1800s up through the early 1900s. Unfortunately, unretrofitted URM structures are at a high risk of incurring major damage or failing in a significant lateral-load event, such as an earthquake. Visit our URM Retrofit Solutions page at strongtie.com/urmretrofit to access the tools for assessing and designing needed retrofits to mitigate risk to life, reduce damage and recovery time, and safeguard the historic integrity of these structures.

RFB

Retrofit Bolt

The RFB retrofit bolt is a clean, oil-free, precut threaded rod, supplied with nut and washer. It offers a complete engineered anchoring system when used with Simpson Strong-Tie adhesive. Inspection is easy; the head is stamped with rod length and “No Equal” symbol for identification after installation.

Material: ASTM F1554 Grade 36

Finish: Zinc plated (unless otherwise noted), available in HDG (per ASTM A153)

CNW/HSCNW

Coupler Nuts

Simpson Strong-Tie coupler nuts are a tested and load-rated method to join threaded rod and anchor bolts. The Witness® holes in each nut provides a means to verify when rods are properly installed. The positive stop feature helps ensure even threading into each end of the nut. The CNW exceeds the specified minimum tensile capacity of corresponding **standard-strength** bolts and threaded rod. The HSCNW exceeds the specified minimum tensile capacity of corresponding **high-strength** bolts and threaded rod. Contact Simpson Strong-Tie or see strongtie.com for other coupler nut sizes.

Finish: Zinc plated

Installation:

- Tighten the two rods until each all-thread rod is visible in the Witness hole. Any portion of thread visible in the Witness hole is a correct installation.
- Standard CNW or HSCNW models for use with non-hot-dip galvanized all-thread rod only.
- Couplers available with oversized threads for installation to hot-dip galvanized bolts (order CNW5/8-5/8-OST and CNW7/8-7/8-OST).
- OST couplers are typically oversized on one end of the coupler nut only and will be marked with an “O” on oversized side. Contact Simpson Strong-Tie to order.

General Information and Notes

Holdowns and tension ties represent key components that comprise a continuous load path. In light-frame construction, holdowns are typically used to resist uplift due to shearwall overturning or wind uplift forces. In panelized roof construction, holdowns are used to anchor the concrete or masonry walls to the roof framing.

Holdowns can be separated into two categories — post-installed or cast-in-place. Cast-in-place holdowns, such as the STHD holdowns or the PA purlin anchors are installed at the time of

concrete placement and attached to wood framing with nails. Cast-in-place holdowns are an economical anchorage solution with allowable loads up to 5,300 lb.

After the concrete has been placed, post-installed holdowns are attached to anchor bolts during wall framing. They are attached to the wood framing with nails, Strong-Drive® SD Connector screws and Strong-Drive SDS Heavy-Duty Connector screws or bolts. Post-installed holdowns have allowable loads ranging from about 850 lb. up to nearly 20,000 lb.

Web Applications

The Simpson Strong-Tie Post-to-Foundation Designer allows you to easily design holdowns and anchors that resist uplift loads per latest building codes. Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

The Simpson Strong-Tie Site-Built Shearwall Designer quickly engineers solid wood shearwalls and walls with one opening (FTAO). Specify all the structural components for economical uplift and shear resistance, while meeting drift limits. Visit app.strongtie.com/sbsd to access our Site-Built Shearwall Designer web application.

General Information and Notes (cont.)

Holdown and Tension Tie General Notes:

- Allowable loads have been increased for earthquake or wind load durations with no further increase allowed. Reduce where other loads govern.
- To obtain LRFD values for cast-in-place holdowns (STHD and PA), multiply ASD seismic load values by 1.43 and wind load values by 1.67. For post-installed holdowns, multiply allowable loads by 1.4. See evaluation reports for LRFD deflections.
- Use all specified fasteners.
- The designer must specify anchor bolt type, length and embedment. See pp. 35–41 for SB and SSTB anchor bolts and pp. 44–45 for PAB anchor bolts. See pp. 46–47 for anchor recommendations for each holdown.
- Simpson Strong-Tie Anchor Designer is available for quick and easy design of anchors for wind and seismic conditions as well as cracked and uncracked concrete. See app.strongtie.com/adsc.
- Anchor bolt nut should be finger tight plus $\frac{1}{4}$ to $\frac{1}{2}$ turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken not to over-tighten the nut. Impact wrenches should not be used.
- Post or beam by designer. Minimum no. 2 or better unless noted otherwise. Tabulated loads are based on installation into the wide face of a minimum $3\frac{1}{2}$ " wide solid or built-up post or beam (in a $3\frac{1}{2}$ " wall), unless noted otherwise. Posts may consist of multiple members provided they are connected independently of the holdown fasteners. See strongtie.com/posts for common post allowable loads.
- Holdowns are for use in vertical or horizontal applications.
- Tension values are valid for holdowns installed flush or raised off the sill plate.
- Deflection at Allowable Tension Load is determined by testing on wood posts and includes fastener slip, holdown deformation and anchor rod elongation for holdowns installed 6" above top of concrete ($4\frac{1}{2}$ " for HTT). Holdowns may be installed any height above top of concrete without load reduction provided that additional elongation of the anchor rod is accounted for. **In floor-to-floor applications, the combined deflection should be determined using the sum of the holdown deflection in the upper wall and the holdown deflection in the lower wall, plus the deflection due to additional rod elongation.** Holdown deflections may be linearly reduced for design loads less than the allowable load.
- To accommodate a $1\frac{1}{2}$ " max. offset anchor bolt, holdowns may be installed raised up to 18" above the top of concrete with no load reduction provided that additional elongation of the anchor rod is accounted for.
- Tabulated loads for holdowns may be doubled when holdowns are installed on opposite sides of the wood member. For nailed and screwed holdowns, the member must be thick enough to prevent opposing holdown fastener interference or the holdowns must be offset to eliminate fastener interference. Designer must evaluate the allowable load of the wood member and the anchorage.**
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions due to narrow face installations.
- Some holdown models are available in stainless steel. Refer to engineering letter L-C-SSHD at strongtie.com for stainless-steel holdown allowable loads.

Horizontal HTT Installation

HDQ8/HHDQ

Holdowns

The HHDQ series of holdowns combines low deflection and high loads with ease of installation. The unique seat design of the HDQ8 greatly minimizes deflection under load. Both styles of holdown employ the Strong-Drive® SDS Heavy-Duty Connector screws which install easily, reduce fastener slip and provide a greater net section when compared to bolts. They may be installed either flush or raised off the mudsill without a reduction in load value.

Special Features:

- Strong-Drive SDS Heavy-Duty Connector screws are supplied with the holdowns to ensure proper fasteners are used
- No stud bolts to countersink at openings

Material: HDQ8 — 7 gauge; HHDQ — body: 7 gauge, washer: ½" plate

Finish: HDQ8 — galvanized; HHDQ — Simpson Strong-Tie gray paint; HHDQ11 — available in stainless steel

Installation:

- See Holdown and Tension Tie General Notes on pp. 51–52
- No additional washer is required
- Strong-Drive SDS Heavy-Duty Connector screws install best with a low-speed high-torque drill with a ⅜" hex-head driver

HHDQ11 / HHDQ14:

- No additional washer is required
- HHDQ14 requires a heavy-hex anchor nut (supplied with holdown)

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

HDQ8 Vertical Installation

HHDQ11
(HHDQ14 similar)Vertical HHDQ11 Installation
(HHDQ14 similar)**Not sure you have the right holdown?**

The Post-to-Foundation Designer is a quick way to specify a holdown and the applicable anchorage to meet your project design requirements. Visit app.strongtie.com/pfd to access the web app.

These products are available with additional corrosion protection. For more information, see p. 16.

For stainless-steel fasteners, see p. 23.

	Model No.	Ga.	Dimensions (in.)					Fasteners		Minimum Wood Member Size (in.)	Allowable Tension Loads (160)			Code Ref.
			W	H	B	CL	SO	Anchor Bolt Dia. (in.)	SDS Screws		DF/SP	SPF/HF	Deflection at Allowable Load (in.)	
HDQ8-SDS3	7	2⅞	14	2½	1¼	2⅝	⅞	(20) ¼" x 3"	3 x 3½	5,715	4,915	0.073	IBC® FL, LA	
								(20) ¼" x 3"	3½ x 3½	7,630	6,560	0.091		
								(20) ¼" x 3"	3½ x 4½	9,230	7,020	0.095		
SS	HHDQ11-SDS2.5	7	3	15⅝	3½	1½	⅞	1	(24) ¼" x 2½"	3½ x 5½	11,810	8,425		0.131
HHDQ14-SDS2.5	7	3	18¾	3½	1½	⅞	1	(30) ¼" x 2½"	3½ x 7¼	13,015	10,530	0.107		
									5½ x 5½	13,710	10,530	0.107		

1. HHDQ14 requires a heavy-hex anchor nut (supplied with holdown).

2. HDQ and HHDQ installed horizontally achieve compression loads with the addition of a standard nut on the underside of the load transfer plate. Refer to ICC-ES ESR-2330 for design values. HDQ8 requires a standard nut and BP 7/8-2 load washer (sold separately) on the underside of the holdown for compression load. Design of anchorage rods for compression force shall be per the designer.

3. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

HDU/DTT™

Holdowns

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

HDU holdowns are predeflected during the manufacturing process, virtually eliminating deflection under load due to material stretch. They use Strong-Drive® SDS Heavy-Duty Connector screws which install easily, reduce fastener slip and provide a greater net section when compared to bolts.

The DTT tension ties are designed for lighter-duty holdown applications on single 2x posts. The DTT1Z is installed with nails or Strong-Drive SD Connector screws and the DTT2 installs easily with the Strong-Drive SDS Heavy-Duty Connector screws (included). The DTT1Z holdowns have been tested for use in designed shearwalls and prescriptive braced wall panels as well as prescriptive wood-deck applications (see pp. 314–315 for deck applications).

For more information on holdown options, contact Simpson Strong-Tie.

HDU Features:

- Uses Strong-Drive SDS Heavy-Duty Connector screws which install easily, reduce fastener slip and provide a greater net section area of the post compared to bolts
- Strong-Drive SDS Heavy-Duty Connector screws are supplied with the holdowns to ensure proper fasteners are used
- No stud bolts to countersink at openings

Material: See table

Finish: HDU — galvanized; DTT1Z and DTT2Z — ZMAX® coating; DTT2SS — stainless steel

Installation:

- See Holdown and Tension Tie General Notes on pp. 51–52.
- The HDU requires no additional washer; the DTT requires a standard-cut washer (included) be installed between the nut and the seat.
- Strong-Drive SDS Heavy-Duty Connector screws install best with a low-speed high-torque drill with a 5/8" hex-head driver.
- Fasteners and crescent washer are included with the holdowns. To order replacements, order part no. SDS25212-HDU_. (Fill in the size needed, e.g., HDU2.)

Codes: See p. 13 for Code Reference Key Chart

1. HDU14 requires heavy-hex anchor nut to achieve tabulated loads (supplied with holdown).
2. HDU14 loads on 4x6 post are applicable to installation on either the narrow or the wide face of the post.
3. **Fasteners:** Nail dimensions are listed diameter by length. SD and SDS screws are Simpson Strong-Tie Strong-Drive SD Connector and SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Typical HDU Tie Between Floors

Typical DTT2Z Installation

LTT/HTT

Tension Ties

Tension ties offer a solution for resisting tension loads that are fastened with nails or Strong-Drive® SD Connector screws. The new LTTP2 light tension tie, designed for wood joist attachments to concrete or masonry walls, features two separate nailing patterns: obround holes spaced 3" apart for I-joist purlins and square holes spaced to accommodate the narrow face of 2x solid-sawn purlins. LTTP2 may also be installed vertically on the wide face of a minimum 2x4 stud for holdown application. It features an extruded anchor bolt hole to accommodate $\frac{3}{4}$ ", $\frac{5}{8}$ " and $\frac{1}{2}$ " bolt diameters.

The LTTI31 is designed for wood chord open-web truss attachments to concrete or masonry walls.

The HTT4 and HTT5 tension ties feature an optimized nailing pattern which results in better performance with less deflection. HTT5KT is sold as a kit with the holdown, bearing plate washer and Strong-Drive SD Connector screws.

The HTT5- $\frac{3}{4}$ " is designed to use a $\frac{3}{4}$ "-diameter anchor bolt.

When using LTT or HTT tension ties with unreinforced concrete masonry, $\frac{3}{4}$ " post-installed anchor bolts are commonly used.

Material: See table

Finish: Galvanized. May be ordered HDG.

Installation:

- See Holdown and Tension Tie General Notes on pp. 51–52.
- LTTP2 — one standard cut-washer is required when using $\frac{1}{2}$ " and $\frac{5}{8}$ " anchor bolts; and no additional washer is required for $\frac{3}{4}$ " anchor bolts.
- LTTP2 — For installations on narrow edge of solid sawn (2x, 3x) joists use (15) square holes; for all other installations use (12) obround holes.
- For tension ties installed over wood structural panel sheathing, use a 2½"-long fastener minimum.
- For information about marriage strap at panelized roof applications, see strongtie.com.
- HTT5-KT requires BP 5/8-2 bearing plate and #10 x 2½" SD Strong-Drive screws (included in kit).

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

See footnotes to

We've made selecting the right anchor bolt for the holdown easier; check out our Holdown Anchorage Solutions table on p. 46 or visit app.strongtie.com/pfd to access the Post-to-Foundation Designer web application.

HDB/HD

Holdowns

Simpson Strong-Tie offers a wide variety of bolted holdowns offering low-deflection performance for a range of load requirements.

The HD3B is a light-duty holdown designed for use in shearwalls and braced-wall panels, as well as other lateral applications.

The HD5B, HD7B and HD9B bolted holdowns incorporate the proven design of our HDQ8 SDS-style holdown and feature a unique seat design which greatly minimizes deflection under load. HDB and HD holdowns are self-jigging, ensuring that the code-required minimum of seven bolt diameters from the end of the post is met. They can be installed directly on the sill plate or raised above it and are suitable for back-to-back applications where eccentricity is a concern. HDBs and HDs are designed to provide loads for intermediate-load-range shearwalls, braced-wall panels and lateral applications.

Material: See table

Finish: HD3B/HD5B/HD7B/HD9B — Galvanized;

HD — Simpson Strong-Tie gray paint; HDG available.

For stainless steel options, see engineering letter L-C-SSHD at strongtie.com.

Installation:

- See Holdown and Tension Tie General Notes on pp. 51–52
- Bolt holes shall be a minimum of $\frac{1}{32}$ " to a maximum of $\frac{1}{16}$ " larger than the bolt diameter (per 2015/2018 NDS, section 12.1.3.2)
- Stud bolts should be snugly tightened with standard cut washers between the wood and nut (BPs are required in the City and County of Los Angeles)
- HD and HDB holdowns are self-jigging and will ensure minimum bolt end distance when installed flush with the sill plate
- Standard cut washer is required under the anchor nut for HD12 with 1" anchor and HD19 with $1\frac{1}{8}$ " anchors

Codes: See p. 13 for Code Reference Key Chart

- To achieve published loads, machine bolts shall be installed with the nut on the opposite side of the holdown. If this orientation is reversed, the designer shall reduce the allowable loads shown per NDS requirements when bolt threads are in the shear plane.
- All references to bolts are for structural quality through bolts (not lag screw or carriage bolts) equal to or better than ASTM A307, Grade A.
- HD19 with 1¼" anchor rod requires No. 1 post (or better) to achieve published loads.

LSTHD/STHD

Strap-Tie Holdowns

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The STHD is an embedded strap-tie holdown offering high load and a staggered nail pattern to help minimize splitting. The STHD incorporates many features that aid correct installation and improve performance. When installed on the forms with the StrapMate® SM1™ strap holder (see p. 62) the unique design of the STHD delivers enhanced stability before and during the pour to help prevent both parallel and perpendicular movement (relative to the form). This results in accurate positioning of the strap and reduced possibility of spalling.

Features

- The pattern allows for nailing to the edges of double 2x's
- Strap nail slots are countersunk to provide a lower nail head profile
- The slots below the embedment line enable increased front-to-back concrete bond and help to reduce spalling
- Rim joist (RJ) models accommodate up to a 17" clear span without any loss of strap nailing

Material: LSTHD8, LSTHD8RJ — 14 gauge; all others — 12 gauge

Finish: Galvanized

Installation:

- See Holdown and Tension Tie General Notes on pp. 51–52.
- Use tables for both standard concrete and post-tension slab installations.
- Install before concrete pour with a StrapMate, or other holding device.
Use of StrapMate SM1 aids in keeping STHD plumb during installation.
- Nail strap from the bottom up. Install strap plumb.
- Strap may be bent one full cycle (bent horizontal 90° then bent vertical) to aid wall placement, but may cause spalling behind the strap. If the spall is 1" or less, measured from the embedment line to the bottom of the spall, full loads apply. 1" to 4" spalls for LSTHD8 achieve 0.9 times table loads. STHD10 and STHD14 achieve full load for spalls less than 4". Any portion of the strap left exposed should be protected against corrosion.
- Other than where noted in the two-pour detail, do not install where:
 - (a) A horizontal cold joint exists within the embedment depth between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load, or the slab is designed to resist the load imposed by the anchor;
 - or (b) Slabs are poured over concrete block foundation walls.
- Additional studs attached to the shearwall studs or post may be required by the designer for wall sheathing nailing.
- Wood shrinkage after strap installation across horizontal members may cause strap to buckle outward.
- For installations in severe corrosion environments, refer to strongtie.com/cipcorrosion for additional considerations.
- See installation illustrations on p. 61 for rebar information.

For Two-Pour Installation for Downturn Footings

- For STHD10 installed through a 4"-thick slab, use the equivalent 8"-stemwall loads of the LSTHD8
- For STHD14 installed through a 4"-thick slab, use the equivalent 8"-stemwall loads of the STHD10
- For STHD14 installed through a 6"-thick slab, use the equivalent 8"-stemwall loads of the LSTHD8

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

Nails are countersunk for a low-profile strap surface.

Typical STHD14RJ
Rim Joist Application

- Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
- 0.148" x 3" or 0.148" x 2 1/2" nails may be used as a direct replacement for the required nails shown in the table with no load reduction when they are installed directly over framing or over 1/2" maximum structural sheathing.
- Use the number of nails listed in the table or as otherwise specified. In many cases, not all nail holes will be filled. Nail strap from the bottom up.
- Deflection at the highest allowable loads for installations over wood double studs is as follows: Installed on framing: LSTHD8 = 0.089", STHD10 = 0.117", and STHD14 = 0.118". Installed over 1/2" maximum structural sheathing: LSTHD8 = 0.114", STHD10 = 0.146", and STHD14 = 0.164".
- To obtain LRFD values, multiply ASD seismic load values by 1.43 and wind load values by 1.67.
- Per 2012, 2015, 2018 and 2021 IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
- Minimum center-to-center spacing is three times the required embedment, $3 \times l_e$, for STHD strap-tie holdowns acting in tension simultaneously. Midwall installation is based on $1.5 \times l_e$ end distance.
- See technical bulletin T-C-SCLCLM at strongtie.com for installation on structural composite lumber posts or columns.
- For brick ledge applications, use full loads shown for STHD14 installed in 8" stem wall.
- For slab-on-grade installation, use full loads shown for LSTHD/STHD installed in 8" stem wall.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Spall Reduction System for STHD Holdown

Features

- Built-in tab
- StrapMate® SM1™ locator line
- Additional diamond hole in RJ versions

Benefits

Built-in Tab:

- Reduces spalling and costly retrofits
- No additional labor to install
- Holds STHD away from form board

StrapMate Locator Line:

- Easy inspection to ensure proper location
- Allows adjustment without removing STHD

Additional Diamond Hole:

- One more fastener to help prevent the STHD RJ models from bowing out at the rim joist section

LSTHD/STHD

Strap-Tie Holdowns (cont.)

StrapMate®

Strap Holder

The StrapMate SM1™ is designed to keep the STHD and LSTHD straps vertically aligned during the concrete pour to minimize possibility of spalling. The friction fit allows for quick and easy installation.

Features:

- The StrapMate is reusable
- Works with STHD, LSTHD
- Designed to fit $\frac{3}{4}$ " plywood forms up to $1\frac{1}{4}$ " LVL forms and larger
- The strap is positioned off the front edge of the form board

Material: Engineered composite plastic

Model No.	Nails (in.)
SM1	(2) 0.131 x 2½ Duplex

PA

Strap-Tie Holdown

The PA strap-tie holdown is a wood-to-concrete connector that connects studs to the foundation to satisfy engineering and code requirements.

Material: 12 gauge

Finish: Galvanized or ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes
- For additional length, an MST strap can be attached using ½" bolts through existing holes
- Visit strongtie.com for additional information

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

These products are available with additional corrosion protection. For more information, see p. 16.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Wind and SDC A&B — Allowable Tension Loads							
Model No.	Strap Length, L (in.)	l _e (in.)	Uncracked Concrete		Cracked Concrete		Code Ref.
			Required Nails (in.)	Tension	Required Nails (in.)	Tension

PA68	70	4	(10) 0.148 x 3	2,025	(10) 0.148 x 3	2,025	

SDC C-F — Allowable Tension Loads							
Model No.	Strap Length, L (in.)	l _e (in.)	Uncracked Concrete		Cracked Concrete		Code Ref.
			Required Nails (in.)	Tension	Required Nails (in.)	Tension	
PA51	51	4	(10) 0.148 x 3	2,025	(10) 0.148 x 3	1,840	IBC, FL
PA68	70	4	(10) 0.148 x 3	2,025	(10) 0.148 x 3	1,840	

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
3. Masonry applications require grout-filled CMU with minimum compressive strength of $f'_m = 1,500$ psi.
4. Deflection at highest allowable load is as follows: PA51 and PA68 = 0.10".
5. PA allowable lateral loads are $F_1 = 795$ lb. and $F_2 = 280$ lb.
6. #9 x 1½" Strong-Drive SD Connector screws (SD9) may be substituted for table fasteners with no load reduction.
7. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical PA51 Installation
(PA68 similar)

Typical PA Connecting Stud to Foundation

PA51
(PA68 similar)

Minimum Two Straps per Pier
Minimum 4" Embedment into Footing
Per ICC 600-2020, Section 505.2.2.2., the assembly shown above is limited to 140 mph, SDC A and B, and one- and two-story buildings.

PA/HPA/PAI/MPAI

Purlin Anchors

Embedded purlin anchors offer solutions for wood-to-concrete and concrete-block connections which satisfy code requirements. The HPA offers the highest capacity in concrete. The PA's dual-embedment line allows installation in concrete or concrete block.

Material: PA/PAI — 12 gauge; HPA — 10 gauge; MPAI — 14 gauge

Finish: Galvanized; PAs available HDG or ZMAX® coating

Installation:

- Use all specified fasteners; some models have extra fastener holes. See General Notes.
- Purlin anchor must hook around rebar.
- Allowable loads are for a horizontal installation into the side of a concrete or masonry wall.
- For vertical installation in the top of GFCMU, refer to engineering letter L-C-PAGFCMUUP on strongtie.com.
- Strap may be bent one full cycle.
(Bent vertical 90° then bent horizontal.)

Edge Distance — Minimum concrete edge distance is 5". Minimum concrete block left-to-right edge distance is 20".

Concrete Block Wall — The minimum wall specifications are:

- One #4 vertical rebar, 32" long, 16" each side of anchor
- Two courses of grout-filled block above and below the anchor (no cold joints allowed)
- A horizontal bond beam with two #4 rebars, 40" long, a maximum of two courses above or below the anchor
- Minimum masonry compressive strength, $f'_m = 1,500$ psi

Options: See LTT and HTT tension ties for alternate retrofit solutions

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pfd to access our Post-to-Foundation Designer web application.

PA/PAI/MPAI Purlin to Grout-Filled Concrete-Block Wall
(refer to installation notes above)

PAI Purlin to Concrete Wall
(MPAI similar)

PA/HPA Purlin to Concrete Wall
PAI/MPAI for I-joist applications

ASCE7 12.11.2.2.5 States:

... Diaphragm to structural wall anchorage using embedded straps shall have the straps attached to or hooked around the reinforcing steel, or otherwise terminated to effectively transfer forces to the reinforcing steel.

PA/HPA/PAI/MPAI

Purlin Anchors (cont.)

These products are available with additional corrosion protection. For more information, see p. 16.

- Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- Deflection listed is at the highest allowable load.
- Multiply seismic and wind ASD load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.
- Nail quantities are based on Douglas fir (DF) or equivalent specific gravity of 0.50 or better. For use in spruce-pine-fir (SPF) or hem-fir (HF), nail quantities shall be increased by 1.15 to achieve loads listed.
- For wall anchorage systems in SDC C-F, the maximum strap allowable load shall not be less than 1.4 times the ASD anchor design load.
- Minimum center-to-center spacing is 3x the required embedment — i.e., standard installation is based on a minimum 5" end distance.
- Structural composite lumber beams have sides that show either the wide face or the lumber strands/veneers. Values in the tables reflect installation into the wide face.
- Concrete shall have a minimum compressive strength of $f'_c = 3,000$ psi.
- Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
- PA models installed vertically in the top of a grouted masonry wall with 6" embedment and (12) 0.148" x 3" nails achieve an allowable uplift load of 1,890 lb.
- For PA models, 0.148" x 1½" nails may be substituted for 0.148" x 3" nails at 100% of listed load and with a 15% increase in deflection. For installation over sheathing, use 3"-long nails minimum.
- For PAI/MPAI models, 0.148" x 1½" nails shall be used directly onto framing member. For installation over sheathing, use 2½"-long nails minimum.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Continuous Load Path

This drawing shows the connection points for a continuous load path from the rafters to the foundation of a two-story house.

Building with a continuous load path is an essential part of creating a structure better able to withstand the forces of mother nature.

This drawing is for illustrative purposes only and should not be considered an engineered system. Refer to the page numbers for the full range of Simpson Strong-Tie connectors. Consult a qualified designer to ensure that correct connector quantities and installation methods are used to achieve the full design load values.

For additional continuous load path connection options, see *F-C-HWG High Wind Guide*, at strongtie.com.

Bases and Caps General Notes

- Uplift and lateral loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Downloads are based on full bearing of the post on the post base and post cap. Downloads may not be increased for short-term loading, and shall be reduced where limited by the post allowable load. See strongtie.com/posts for common post allowable loads.
- For post bases with 1" standoffs, full bearing on concrete is required. Standoffs shall bear on top of concrete and not be embedded into wet concrete. A higher download may be achieved by solidly packing grout in the 1" standoff area before installation of the post. Allowable download shall be based on the capacity of the post, grout or concrete according to the code. (Figure 1)
- The designer is responsible for concrete design.
- For post-installed bases, the designer must specify anchor bolt type, length and embedment. Titen HD®, Stainless-Steel Titen HD and SET-3G™ are some of the retrofit anchor options. For more information, refer to our *Anchoring, Fastening, Restoration and Strengthening Systems for Concrete and Masonry* catalog at strongtie.com.
- Except for the MPBZ moment post base, post bases do not provide adequate resistance to prevent members from rotating about the base and are therefore not recommended for non-top-supported installations (such as fences, patio covers, pergolas or unbraced carports). The top of the post must be restrained from moving horizontally by some other means, e.g., by tying the roof into a supporting structure or by adding knee bracing between the posts and beams. (Figure 2) Alternatively, see the MPBZ on pp. 82–83 for a post base that provides moment resistance for columns or posts. (Figure 3)
- For post bases that do not attach to all four sides of the post, the post may be wider than the base and overhang the base in one direction (e.g., a 6x8 post on an ABU66Z) as long as the bearing area provided by the base is sufficient for the post.
- For applications involving the use of a post base to support a wood beam, refer to p. 70. (Figure 4)
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Allowable loads for caps and bases reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions due to narrow face installations. Some products require installation of fasteners into the wide face only.
- Unless otherwise noted, allowable downloads for post caps are based on the assumption that the wood post is at least as wide as the supported beam. For applications where this condition is not met (e.g., a 6x10 beam supported by 4x4 post), the designer must evaluate the download capacity.
- Allowable lateral loads for post caps can only be achieved if one of the members, the post or beam, is supported laterally by other means. (Figure 2) For applications involving lateral load transfer from the beam to the column, the column must be designed to receive the load without rotating about its base (e.g., cantilevered out of the ground, diagonally braced, or connected at the base with a moment-resisting connector like the MPBZ post base).
- Post cap allowable loads are for a continuous beam. Unless otherwise noted, the beam may be spliced at the centerline of the post, and the maximum allowable download for each spliced beam is one half of the cap's tabulated allowable download. For CC, CCQ and CCOS caps, the download for each spliced beam shall also not exceed 2x the download of the other spliced beam. Eccentricity induced in the post by spliced beams must be evaluated by the designer. Tabulated uplift and lateral loads do not apply to spliced beam conditions. When spliced beams must be connected together to transfer design tension loads (lateral loads parallel to the beams), the connection must be by means other than the post cap.
- Post caps may be installed inverted for post-to-beam applications. The designer is responsible for evaluating the beam to ensure it is capable of receiving all loads applied by the post. (Figure 5)

RPBZ

Retrofit Post Base

The RPBZ retrofit post base is designed to reinforce existing posts and columns. The single, versatile model will fit on any size post consisting of a double 2x4 or larger. RPBZ can also be used to reinforce new post-base connections, such as braced carports, patio covers, decks and other structures. The RPBZ can be installed with the CPS composite plastic standoff to meet a 1" post standoff code requirement. (For more information about the CPS, see p. 345.) A single RPBZ can be installed on a post that is flush to a corner, and two RPBZs can be installed at away-from-edge conditions to fortify the post-base connection to resist both wind and seismic forces.

Strong-Drive® SDS Heavy-Duty Connector screws install easily and provide excellent holding strength for post-to-flange connections. Additionally, the RPBZ can be purposed as a temporary base fixture for posts when shoring beams. RPBZ comes standard in ZMAX® finish to meet exposure conditions in many environments. See additional corrosion information at strongtie.com/corrosion.

Material: 12 gauge

Finish: ZMAX coating

Installation:

- Use all specified fasteners; see General Notes.
- 1/4" x 1 1/2" Strong-Drive SDS Heavy-Duty Connector and base connection fasteners are not provided with RPBZ. Simpson Strong-Tie CPS series composite post standoff sold separately.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations, such as fences or unbraced car ports.

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

RPBZ Connector-Only Values

Model No.	Part Qty.	Post Size	Fasteners				DF/SP Allowable Connector Loads			Code Ref.
			Base Connection ^{4,5}		Post		Uplift (160)	F ₂ (160)	F ₃ (160)	
			Type	Qty.	Type	Qty.				
RPBZ	Connection to Concrete									IBC®, FL, LA
	1	4x, 6x	¾" anchor bolt or ¼" Titen Turbo™ screw	2 anchors or 4 screws	¼" x 1 ½" SDS	4	1,500	1,005	485	
	2			4 anchors or 8 screws		8	2,235	1,115	1,115	
	Connection to Wood Framing									
	1	4x, 6x	¼" x 3" SDS	4	¼" x 1 ½" SDS	4	1,335	1,005	485	
	2			8		8	2,235	1,115	1,115	
	1		¼" x 1 ½" SDS	4		4	845	1,005	485	
	2			8		8	1,825	1,115	1,115	

See footnotes below.

RPBZ Anchorage-to-Concrete Values

Model No.	Part Qty.	Post Size	Fasteners		Allowable Anchorage Loads			
			Base Connection		Uplift		F ₂	F ₃
			Type	Qty.	Uncracked	Cracked		
RPBZ	Corner – Post Flush to Edge							
	1	4x, 6x	¼" x 1¾" Titen Turbo screw	4	750	—	820	820
			⅝"-diameter anchor	2	1,520	1,085	510	510
	Away from Edge							
	1	4x, 6x	¼" x 1¾" Titen Turbo screw	4	850	—	935	935
			⅝"-diameter anchor	2	2,190	1,565	1,265	1,265
	2		¼" x 1¾" Titen Turbo screw	8	1,500	—	1,645	1,645
			⅝"-diameter anchor	4	3,635	2,595	1,730	1,730

1. Allowable load for design shall not exceed minimum of Connector Only Value and Anchorage to Concrete Value.
2. Allowable connector loads are based on DF/SP lumber. For SPF/HF, multiply table loads by 0.86.
3. Double 2x4s may be used in lieu of 4x4 post.
4. For installation on 6x or larger members, if four RPBZ post bases are used, allowable loads may be taken to be 1.5 x the tabulated two-part value.
5. For installations into concrete, the minimum compressive strength is $f'_c = 2,500$ psi. Designer is responsible for concrete member uplift design.
6. Away-From-Edge loads require face of wood post to be a minimum of 2½" away from near edge of concrete on all four sides of the post.
7. Allowable anchorage to concrete uplift and shear loads for the ¾" diameter anchors are calculated per ACI 318-19. Shear loads assume cracked concrete while uplift loads consider both cracked and uncracked concrete values, and all are qualified for Wind and Seismic Design Categories A&B.
8. Embedment depth for these post-install anchors must be a minimum of 2¾" and are for use with SET-3G™ or AT-3G™ structural anchoring adhesives or Titen HD® screw anchors.
9. Allowable uplift and shear loads for the Titen Turbo masonry screws do not carry a particular "cracked" or "uncracked" designation.
10. Titen Turbo masonry screws and non-stainless-steel Titen HD screw anchors should be used only in interior-dry and noncorrosive environments.
11. For connection to wood framing, loads are based on penetration of the Strong-Drive® SDS Heavy-Duty Connector screw's entire threaded section into the main member. If thread penetration into the main member is less than the "Thread Length" as shown in the table (see p. 361) for DF/SP, reduce allowable load by 172 lb./in. of thread not in the main member. Use 121 lb./in. for SPF/HF. **Exception:** installations onto ¾" southern yellow pine deck boards where screw tips protrude through the backside achieve full load.

ABA/ABU/ABW

Adjustable and Standoff Post Bases

Additional standoff bases are on p. 345.

The AB series of retrofit adjustable post bases provide a 1" standoff for the post, are slotted for adjustability and can be installed with nails, Strong-Drive® SD Connector screws or bolts (ABU). Depending on the application needs, these adjustable standoff post bases are designed for versatility, cost-effectiveness and maximum uplift performance.

Features:

- The slot in the base enables flexible positioning around the anchor bolt, making precise post placement easier
- The 1" standoff helps prevent rot at the end of the post and meets code requirements for structural posts installed in basements or exposed to weather or water splash

Material: Varies (see table)

Finish: ZMAX® coating and some in stainless steel

Installation:

- Use all specified fasteners; see General Notes.
- See our *Anchoring, Fastening, Restoration and Strengthening Systems for Concrete and Masonry* catalog, or visit strongtie.com for retrofit anchor options, such as Titen HD®, Stainless-Steel Titen HD or SET-3G™.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports).
- Place the base, cut washer(s) or load transfer plate(s) and nut(s) on the anchor bolt(s). Make any necessary adjustments to post placement and tighten the nut securely on the anchor bolt.
- See strongtie.com for information on hollow column installation.

ABW

Place the standoff base and then the post in the ABW and fasten on three vertical sides, using nails or Strong-Drive SD Connector screws

- Bend up the fourth side of the ABW and fasten using the correct fasteners

ABU

Place the standoff base and then the post in the ABU

- Fasten using nails or Strong-Drive SD Connector screws or bolts (ABU88Z, ABU1010Z, ABU1212Z – SDS optional)

ABA

Place the post in the ABA

- Fasten using nails or Strong-Drive SD Connector screws

Codes: See p. 13 for Code Reference Key Chart

SD Many of these products are approved for installation with Strong-Drive SD Connector screws. See pp. 362–366 for more information.

Allowable Loads — Beam Installation

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Downloads may not be increased for short-term loading.
- Specifier is to design concrete and anchorage for uplift capacity.
- Beam depth must be a minimum of 7 1/4".
- Shims are required for ABU46Z double 2x (1 shim) and ABU66Z triple 2x (2 shims) installations as shown in the illustration. Additional fastening of shim to beam is not required.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

ABU66Z Beam Installation

ABA/ABU/ABW

Adjustable and Standoff Post Bases (cont.)

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Downloads may not be increased for short-term loading.
- Specifier is to design concrete and anchorage for uplift loads.
- Some ABU products may be installed with either bolts or nails (not both) to achieve table loads. ABU88Z, ABU88RZ, ABU1010Z, ABU1010RZ, ABU1212Z and ABU1212RZ may be installed with eight 1/4" x 3" Strong-Drive SDS Heavy-Duty Connector screws (sold separately) for the same table load.
- All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
- For higher downloads, pack grout solid under 1" standoff plate before installation. Base download on column or concrete, according to the code.
- HB dimension is the distance from the bottom of the post up to the first bolt hole.
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. For SCL columns, the fasteners for these products should always be installed in the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for more information.
- Downloads shall be reduced where limited by allowable loads of the post.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

CPTZ™

Concealed Post Tie

The CPTZ concealed post base provides a clean, concealed look while providing a 1" standoff height above concrete. The 1" standoff reduces the potential for decay at the post end and satisfies code requirements for posts that are exposed to weather, water splash or in basements. It is part of a system of concealed connectors that includes the CBTZ and CJTZ.

- The CPTZ is tested and load-rated for uplift, download and lateral load.
- Simpson Strong-Tie saves installers time by providing all the necessary components to make the post connection in one box (anchors not included).
- There are two anchorage solutions available. See tables for information.
- Solutions have been calculated per ACI 318 to determine their allowable load in different concrete configurations.

Material: See table below

Finish: Knife plate, washers and standoff base are ZMAX®-galvanized steel. The standoff base has an additional textured, flat black powder-coat finish for aesthetic purposes. The ½"-diameter drift dowels are mechanically galvanized in accordance with ASTM B695, Class 55. If substituting ½"-diameter bolts, a hot-dip galvanized finish is recommended. Some available in stainless steel (see table).

Installation:

- Use all specified fasteners; see General Notes
- More extensive installation instructions are available through our Literature Library app or by visiting strongtie.com
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-braced, or non-top-supported installations

Codes: See p. 13 for Code Reference Key Chart

Typical CPT44Z Installation

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

	Model No.	Nominal/ Rough Post Size	Base (ga.)	Knife Plate (ga.)	Dimensions (in.)		Fasteners				DF/SP Allowable Loads				Code Ref.
					W	L	Anchor		Post		Uplift (160)	Down (100)	F ₁ (160)	F ₂ (160)

										½" bolt	4,055				
	CPT88Z	8x8	12	10	7¼	7¼	2	½	3	½" x 4¾" dowel	3,315	22,805	740	1,080	
										½" bolt	4,055				

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Downloads shall be reduced where limited by capacity of the post.

3. CPTZ concealed post ties are supplied with (3) 1/2"-diameter dowel pins. Alternative 1/2"-diameter hex- or square-head bolts may be used for loads listed.

4. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

5. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers.

For SCL columns, the fasteners for these products should always be installed in the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for more information.

Concealed Post Tie (cont.)

Anchor Option 1 — CPTZ Anchorage Using SET-3G™ Anchoring Adhesive

Model No.	Embed. (in.)	Edge Distance (in.)	Allowable Uplift		
			Anchorage		CPTZ
			Uncracked	Cracked	
Corner — Flush Edge					
CPT44Z	2¾	—	505	405	3,035
CPT66Z	2¾	—	580	465	3,315
CPT88Z	2¾	—	625	500	3,315
Corner — Near Edge					
CPT44Z	5	4	1,480	1,185	3,035
CPT66Z	5	5	2,025	1,620	3,315
CPT88Z	5	6	2,430	1,945	3,315
Corner — Away from Edge					
CPT44Z	6	9	4,005	3,205	3,035
CPT66Z	7½	11¼	5,440	4,350	3,315
CPT88Z	7½	11¼	5,440	4,350	3,315
10"-Diameter Circular Pedestal					
CPT44Z	5	4	1,560	1,245	3,035
CPT66Z	5	3¾	1,460	1,165	3,315
12"-Diameter Circular Pedestal					
CPT44Z	5	5	2,025	1,620	3,035
CPT66Z	5	4¾	1,935	1,550	3,315
CPT88Z	5	4¾	1,935	1,550	3,315

- Allowable uplift loads are calculated per ACI 318-19 with reference to cracked and uncracked concrete and are qualified for Wind and Seismic Design Categories A&B. Allowable loads are also applicable to detached one- and two-family dwellings in SDC C per IBC®, Section 1613. No further increases allowed.
- Edge distance is considered to be measured from the center line of the nearest anchor bolt to the edge of concrete.
- Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by designer. The registered design professional may specify alternative embedment, footing size, and anchor bolt.
- Lateral loads ($F_1 = F_2$) for Corner — Flush Edge conditions are CPT44Z = 395 lb., CPT66Z = 570 lb., and CPT88Z = 740 lb. For all other installations using CPTZ with SET-3G™ or ET-3G™ anchoring adhesive, use the allowable loads from the CPTZ table above.
- Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.

Anchor Option 2 — CPTZ Cast-in-Place Anchorage

Model No.	Embedment (in.)	Edge Distance (in.)	Allowable Uplift		
			Anchorage		CPTZ
			Uncracked	Cracked	
Corner — Flush Edge					
CPT44Z	2¾	—	870	695	3,035
CPT66Z	2¾	—	1,590	1,270	3,315
CPT88Z	2¾	—	2,435	1,950	3,315
Corner — Away from Edge					
CPT44Z	5	4	3,760	3,010	3,035
CPT66Z	6	5	5,390	4,310	3,315
CPT88Z	6	5	5,390	4,310	3,315
10"-Diameter Circular Pedestal					
CPT44Z	5	4	3,945	3,155	3,035
CPT66Z	5	3¾	3,860	3,090	3,315
12"-Diameter Circular Pedestal					
CPT44Z	5	5	5,170	4,135	3,035
CPT66Z	5	4¾	5,140	4,110	3,315
CPT88Z	5	4¾	5,140	4,110	3,315

- Allowable uplift loads are calculated per ACI 318-19 with reference to cracked and uncracked concrete and are qualified for Wind and Seismic Design Categories A&B. Allowable loads are also applicable to detached one- and two-family dwellings in SDC C per IBC, Section 1613. No further increases allowed.
- Edge distance is considered to be measured from the center line of the nearest anchor bolt to the edge of concrete.
- Tabulated anchor embedments will also achieve the maximum lateral loads from the CPTZ table on p. 72.
- Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by designer. The registered design professional may specify alternative embedment, footing size, and anchor bolt.

EPB

Elevated Post Base

Material: EPB44A — 14 gauge; others — 12 gauge base plate, 1 1/8" OD x 8" pipe

Finish: EPB44A — Galvanized;
all others — Simpson Strong-Tie gray paint
(may be ordered HDG)

Installation:

- Use all specified fasteners; see General Notes
- Allows 1" to 2 1/2" clearance above concrete, 2" for EPB44A
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports)

Options:

- 12" pipe available for EPB44, 46, 66; specify "-12" after model number

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

EPB66	5½	5½	3	(12) 0.162 x 3½	870	605	3,465	850	965	

1. Loads may not be increased for duration of load.
2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
3. Multiply seismic and wind ASD uplift and lateral load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.
4. In accordance with IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
5. Downloads shall be reduced where limited by capacity of the post.
6. Designer is responsible for concrete design.
7. For full loads, the distance to the nearest concrete edge is 4" minimum from the EPB center line.
8. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
9. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

EPB44PHDG

Elevated Post Base

EPB44PHDG can be used both for pier block and cast-in-place installation for 4x4 posts.

Material: 12-gauge base; threaded rod support ¾" x 6", nut and washer are shipped assembled

Finish: HDG

Installation:

- **Secured with Anchoring Adhesive:**
Drill a 7/8"-diameter hole 4" deep minimum and fill the hole halfway with anchoring adhesive (per installation instructions). Insert the EPB44PHDG and adjust to the desired height. The threaded rod shall be embedded a minimum of 3½". Minimum sidecover is 3" from the center of the threaded rod.
- Go to **strongtie.com** for additional information on hole cleaning procedures and cure time for SET-3G™ and AT-3G™ anchoring adhesives.
- **Supported by a Nut:**
Drill a 1"-diameter hole 3½" deep minimum. Insert the EPB44PHDG and adjust to the desired height.
- **Cast-in-Place:**
Embedded end to have a nut and bearing plate with a minimum embedment of 4" from top of concrete to the top of plate.
- Minimum sidecover is 3" from the center of the threaded rod.
- Fully engage at least three threads in the base.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports).

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Model No.	Nails (in.)	Anchor Bolt	DF/SP Allowable Loads				Code Ref.
			Download (100)		Uplift (160)		
			Adhesive or Cast-in-Place	Support by a Nut	SET-3G	AT-3G	
EPB44PHDG	(8) 0.162 x 3 1/2	3/4	3,625	760	1,265	985	—

1. Loads may not be increased for duration of load.
2. Uplift loads require the threaded rod to be attached to cured concrete with SET-3G or AT-3G anchoring adhesive. Cast-in-place installations must have a nut and bearing plate embedded in concrete. Uplift loads do not apply when installed to a pier block.
3. Designer is responsible for concrete design.
4. Downloads shall be reduced where limited by capacity of the post.
5. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. For SCL columns, the fasteners for these products should always be installed in the wide face. See technical bulletin T-C-SCLCLM at **strongtie.com** for load reductions resulting from narrow-face installations.
6. Adhesive anchor design assumptions:
 - (a) Uncracked dry concrete
 - (b) Anchors not for use in SDC C–F where load combinations include earthquake load
 - (c) Temperature range: Maximum short term temperature = 176°F, Maximum long term temperature = 110°F
 - (d) Periodic special inspection assumed per code report
 - (e) Minimum concrete strength of 2,500 psi.
7. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Pier Block Installation
(supported by a nut)

PB/PBS

Regular and Standoff Post Bases

The PBS features a 1" standoff height. It reduces the potential for decay at post and column ends.

Material: PB — 12 gauge; PBS — see table

Finish: Galvanized. Some products available in ZMAX® coating or HDG.

Installation:

- Use all specified fasteners; see General Notes.
- Install either nails or bolts.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports).
- PB — Holes are provided for installation with either 0.162" x 3 1/2" nails or 1/2" bolts for PB66 and PB66R; all other models use 0.162" x 3 1/2" nails only. A 2" minimum sidecover is required to obtain the full load.
- PBS — Embed into wet concrete up to the bottom of the 1" standoff base plate. A 2" minimum side cover is required to obtain the full load. Holes in the bottom of the straps allow for free concrete flow.

Codes: See p. 13 for Code Reference Key Chart

Typical PB Installation

These products are available with additional corrosion protection. For more information, see p. 16.

Typical PBS44A Installation

1. Loads may not be increased for duration of load.
2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
3. Multiply seismic and wind ASD uplift and lateral load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.
4. In accordance with IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
5. Downloads shall be reduced where limited by capacity of the post.
6. For lateral loads for all PB models: F_1 allowable = 765 lb. F_2 allowable = 1,325 lb.
7. Designer is responsible for concrete design.
8. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
9. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
10. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

PB/PBS

Regular and Standoff Post Bases (cont.)

These products are available with additional corrosion protection. For more information, see p. 16.

Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

- For higher downloads, pack grout solid under 1" standoff plate before installation. Base download on column or concrete, according to the code.
- Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
- Multiply seismic and wind ASD uplift and lateral load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.
- In accordance with IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for installations that lack top support (such as fences or unbraced carports).
- Downloads shall be reduced where limited by capacity of the post.
- Designer is responsible for concrete design.
- For lateral loads for all PBS models: F_1 allowable = 1,165 lb. when using nails and 230 lb. when using bolts. F_2 allowable = 835 lb. when using either nails or bolts.
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
- All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

CBS/CBSQ

Column Bases

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The CBS column base installs with bolts and provides tested capacity. The CBSQ uses Strong-Drive® SDS Heavy-Duty Connector screws (included), which allow for fast installation, reduced reveal and high capacity, and provides a greater net section area of the column compared to bolts. Both CBS and CBSQ provide 1" standoff to meet code requirements for structural posts installed in basements or exposed to weather or water splash.

Material: See table

Finish: Galvanized; available in HDG

Installation:

- Use all specified fasteners; see General Notes.
- For CBS, install with two bolts.
- For CBSQ, install ¼" x 2" Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the column base. (Lag screws will not achieve the same load.)
- Install CBS/CBSQ with bottom of standoff flush to top of concrete.
- For full loads, a minimum of 3" side cover shall be provided.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports).

Ordering:

- To order the CBSQ with screws, specify CBSQ-SDS2
- To order the CBSQ without screws, specify CBSQ

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

1. Loads may not be increased for duration of load.
2. For higher downloads, pack grout solid under 1" standoff plate before installation. Base download on column or concrete, according to the code.
3. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
4. Multiply seismic and wind ASD uplift and lateral load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.
5. For lateral loads for all CBSQ models: F_1 allowable = 485 lb., F_2 allowable = 1,270 lb. Minimum 3" side cover required.
6. In accordance with IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
7. Downloads shall be reduced where limited by capacity of the post.
8. Designer is responsible for concrete design.
9. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
10. Fasteners: SDS screws are Simpson Strong-Tie Strong-Drive® SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

CB

Column Base

Material: Strap: CB4x, CB5x, CB6x — 7 gauge;
CB7x and larger — 3 gauge. Base: CB4x through CB9x — 7 gauge;
CB10x — 3 gauge

Finish: CB44, CB46, CB48, CB66, CB68, CB610 — galvanized;
all other CB — Simpson Strong-Tie gray paint or HDG. Some
products available in HDG, stainless steel or black powder coat.
(Note: When ordering powder coat, model number is CBxxPC)

Installation:

- Use all specified fasteners; see General Notes
- For full loads, minimum side cover required is 3" for CB
- Install all models with bottom of base plate flush with concrete
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports)

Options:

- Some CBs are available in rough sizes; add the suffix 'R' to the standard model number.
- Other sizes available for CB; specify W_1 and W_2 dimensions. Consult Simpson Strong-Tie for bolt sizes and allowable loads.

1. Uplift loads may not be increased for duration of load.

2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.

3. Multiply seismic and wind ASD uplift and lateral load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.

4. In accordance with IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.

5. Downloads shall be reduced where limited by capacity of the post.

6. Designer is responsible for concrete design.

7. All references to bolts are for structural quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

8. Tabulated allowable download is based on capacity determined from following compression-parallel-to-grain stress (F_{cl}) for wood post: 1,650 psi for glulam, 1,350 psi for 4"-wide sawn lumber, and 1,000 psi for 5"-wide or wider sawn lumber, as applicable.

MPBZ™

Moment Post Base

The patent-pending MPBZ is specifically designed to provide moment resistance for columns or posts. An innovative overlapping sleeve design encapsulates the post, helping to resist rotation around its base. It is available for 4x4, 6x6 and 8x8 posts. The MPBZ is ideal for outdoor structures, such as carports, fences and decks. Built-in stand-off tabs provide the required 1" stand-off to resist decay of the post while eliminating multiple parts and assembly. Additionally, the MPBZ is available in ZMAX® as the standard finish to meet exposure conditions in many environments. For 10" stemwalls or round footings, see engineering letters, L-C-10MPBZ and L-C-MPBZ at strongtie.com.

Features:

- Internal top-of-concrete tabs
- 1" standoff tabs
- Additional holes provided to attach trim material
- Weep hole provided for water drainage

Material: 12 gauge

Finish: ZMAX coating

Installation:

- Use all specified fasteners; see General Notes.
- Install MPBZ before concrete is placed using embedment level indicators and form board attachment holes.
- Place post on tabs 1" above top of concrete.
- Install Strong-Drive® SDS Heavy-Duty Connector screws, which are supplied with the MPBZ. (Lag screws will not achieve the same load.)
- Concrete level inside the part must not exceed 1/4" above embedment line to allow for water drainage.
- Annual inspection of connectors used in outdoor application is advised. If significant corrosion is apparent or suspected, then the wood, fasteners and connectors should be evaluated by a qualified engineer or inspector.

1. Loads may not be increased for duration of load.
2. Higher download can be achieved by solidly packing grout in the 1" standoff area before installation of the post. Allowable download shall be based on either the wood post design or the concrete design calculated per code.
3. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
4. Tabulated rotational stiffness accounts for the rotation of the base assembly attributable to deflection of the connector, fastener slip, and post deformation. Designer must account for additional deflection attributable to bending of the post.
5. Multiply seismic and wind ASD uplift and lateral load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.
6. In accordance with IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
7. Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by designer.
8. Allowable load shall be the lesser of the wood assembly or concrete allowable load.
9. For loading simultaneously in more than one direction, the allowable load must be evaluated using the following equation: (Design Uplift / Allowable Uplift, or Design Download / Allowable Download) + (Design Moment / Allowable Moment) + (Design Lateral / Allowable Lateral) ≤ 1.0 .
10. To account for shrinkage up to 3%, multiply rotational stiffness by 0.75. Reduction may be linearly interpolated for shrinkage less than 3%.
11. Tabulated load values may be used for rough sawn lumber or larger size posts without reduction factors. Rough-size and larger-size posts shall be planed uniformly on all four sides such that centerline of post is concentric with the center line of MPBZ.

MPB88Z

Reinforced Concrete Footing

Footing (size and reinforcement) by designer. Standard hook geometry in accordance with ACI 318 unless noted otherwise.

SECTION C

PPBZ™

Porch Post Base

The PPBZ porch base offers a simplified, one-time installation designed to support permanent porch framing throughout all stages of construction. This design eliminates the need for temporary vertical support and streamlines the subcontractor scheduling process while still providing adequate safety to enable full access for installers/inspectors.

The porch post base is fastened to the footing with two Titen Turbo™ masonry screws when framing the porch roof. Then, when the time is right, the concrete contractor is able to complete the last phase of the porch slab without the interference of temporary vertical support and without the framer having to return to the jobsite after the slab has hardened. Designed to withstand vertical construction loads prior to embedment in concrete, the PPBZ will support the weight of most framed porches and overhangs.

Features:

- Stiffened embedded side stirrups provide temporary vertical download support without being embedded into concrete
- 1" standoff reduces the potential for decay at post or column ends
- Two available sizes provide both 4"- and 6"-slab thicknesses
- Prepour installation eliminates temporary support
- No disruption in scheduling
- Eliminates additional move-ins by trades and certain inspection call backs

Material: 12 gauge

Finish: ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes.
- Locate and place PPBZ on footing according to framing plans.
- Secure PPBZ to footing with two (1/4" dia. x 1 1/4" long hex-head) Titen Turbo concrete screws (sold separately) located a minimum of 1 1/2" from the edge of concrete.
- Attach 4x4 post to PPBZ using (12) 0.148" x 3" nails. After bracing the top and bottom of the post from lateral movement, the post may then be loaded in download or uplift.
- When ready, pour concrete porch slab (4" or 6") up to the bottom of the standoff base while maintaining minimum 1" concrete side coverage.

Codes: See p. 13 for Code Reference Key Chart

1. Loads may not be increased for duration of load.
2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
3. Multiply seismic and wind ASD uplift and lateral load values by 1.43 or 1.67, respectively, to obtain LRFD capacities.
4. In accordance with IBC, Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
5. Downloads shall be reduced where limited by capacity of the post.

6. Designer is responsible for concrete design.
7. For full loads, 1" concrete side cover is required on all sides.
8. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect straps nailed to the wide face. Do not nail PPBZ straps to the narrow face of SCL columns.
9. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Adjustable Porch Post Base

The PPBF adjustable porch post base safely supports porch framing through all phases of construction, eliminating the need for temporary vertical support and providing a stronger structure for contractors working on and around the porch roof. The seat height of the post base adjusts to accommodate porch-slab thicknesses from 4" to 12", providing contractors with one-time installation of the post base and post at the beginning of construction. This adjustability enables installers to set the post base at the correct height for the later-phase porch-slab pour.

Features:

- Tested and load rated for conditions during framing and after the post base is embedded in concrete
- Available in two sizes to accommodate nominal 4x4 and nominal 6x6 posts
- Accommodates concrete slab thicknesses from 4" to 12" while maintaining a 1" standoff height

Material: Seat — 12 gauge; base plate — 3 gauge;
threaded rod — 3/4"-diameter

Finish: Simpson Strong-Tie gray paint

Installation:

- Use all specified fasteners; see General Notes.
- Locate and place PPBF on foundation according to framing plans.
- Secure PPBF to footing with (2) 3/16" x 1 3/4" Titen Turbo™ hex-head screw anchors located a minimum of 1 1/2" from the edge of concrete.
- Adjust seat height according to length of post specified in framing plans with consideration given for porch slab thickness and standoff (1" min. to 2 1/2" max.). Drill a 7/8" max. diameter hole into bottom of post if necessary or cut all thread rod flush to seat.
- Attach wood post to PPBF using (12) 0.148" x 1 1/2" nails. After bracing the top and bottom of the post from lateral movement, the post may then be loaded in download or uplift.
- When ready, pour concrete porch slab up to 1" from the bottom of the seat of the post base.

PPBF44	4x4	3½	3¼	8	(2) ¾ x 1¼	(12) 0.148 x 1½	410	4,630	1,180	1,850		
PPBF66	6x6	5½	5½	4	(2) ¾ x 1¼	(12) 0.148 x 1½	410	5,350	640	880		
PPBF66	6x6	5½	5½	8	(2) ¾ x 1¼	(12) 0.148 x 1½	410	5,350	1,180	1,355		

1. Loads may not be increased for duration of load.

2. Loads are for DF/SP lumber. For SPF/HF lumber, multiply download by 0.86 and uplift by 1.00.

3. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.

4. Embedded into concrete uplift loads require the minimum slab depths shown and are applicable to uncracked or cracked concrete. Designer may calculate alternate anchorage solutions. Uplift loads shall not exceed Wind & SDC A&B allowable loads.

5. Embedded into concrete seismic uplift loads satisfy overstrength requirements per IBC 1905.1.8 using $\Omega_0 = 2.5$. This reflects $\Omega_0 = 3.0$ (for light-frame wood structural panels) – 0.5 (for flexible diaphragms per ASCE7 Table 12.2-1 footnote b.). Uplift loads between 4" and 8" slab depth may be linearly interpolated.

6. In accordance with IBC Section 1613.1, detached one- and two-family dwellings in Seismic Design Category C may use Wind and SDC A&B values.

7. **Fasteners:** #9 x 1 1/2" Strong-Drive® SD Connector screws may be used in lieu of nails with no reduction. Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Elevated Column Base

The new ECB elevated column base for hollow columns or solid-sawn posts makes it easy to install waterproofing material on stacked balconies in multi-family buildings. It features a 2" standoff, providing enough room for moisture barrier material and a thin finish surface while still allowing for the 1" code-required standoff to prevent post decay. It features flexible anchorage options: four corner holes (screw down to wood) or one center hole (anchor to concrete.) There are two model sizes for 6x6 and 8x8 posts.

Material: Base and tube — 7 gauge; seat — 12 gauge

Finish: Simpson Strong-Tie gray paint; available hot-dip galvanized (add HDG to model no.)

Installation:

- Use all specified fasteners; see General Notes
- If using the single-anchor option (center hole), two ½" standard cut washers are required between the ½" anchor bolt or nut and the post base
- If using the four-anchor option (corner holes), install anchors into slotted holes at slight angle, as close to vertical as post base geometry will allow
- Concrete anchor options include Titen HD® heavy-duty screw anchor, stainless-steel Titen HD heavy-duty screw anchor, SET-3G™ or AT-3G™ high-strength adhesive, or Titen Turbo™ concrete and masonry screw anchor; wood anchor options include Strong-Drive® SDS Heavy-Duty Connector screw
- Post bases do not provide adequate resistance to prevent members from rotating about the base, and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports)

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

2. Downloads may not be increased for short-term loading.

3. Specifier is to design wood or concrete support and anchorage for uplift loads.

4. Two ½" standard cut washers are required between the ½" anchor bolt or nut and the post base.

5. Downloads shall be reduced where limited by the allowable loads of the post.

6. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

BC/BCS

Post Caps

The BCS allows for the connection of (2) 2x's to a 4x post or (3) 2x's to a 6x post. Double-shear nailing between beam and post gives added strength. The BC series offers dual purpose post cap/base for light cap or base connections.

Material: 18 gauge

Finish: Galvanized. Some products available in ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes
- Do not install bolts into pilot holes
- BCS — Install dome nails on beam; drive nails at an angle through the beam into the post below to achieve the table loads
- BC — Install with 0.162" x 3½" nails or 0.162" x 2½" nails
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports)
- To tie multiple 2x members together, the designer must determine the fasteners required to join members to act as one unit without splitting the wood

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

2. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.

3. Base allowable loads assume that nails have full penetration into the supporting member. Loads do not apply to end-grain post installations.

4. Spliced beams, where the ends of two beams are supported by the wood post and connected to the BC post cap connector, are not permitted.

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

AC/ACHZ™/LPCZ™/LCE™/RTC™

Post Caps

These adjustable, two-sided post caps provide design flexibility and easy connection in new construction or retrofit applications where a connection is needed between a beam and post.

- AC4 and AC6 provide convenient mid-beam connections with light or medium fastener choices
- **ACHZ caps provide high capacity with the flexibility to be used mid beam or end beam when flanges are field bent**
- LCE4 gives maximum versatility allowing for various member sizes and end-of-beam installations
- LPCZ caps can straddle wider posts, eliminating the need for shimming
- RTC connects two horizontal members at a corner to a vertical wood member

Material: LCE4 — 20 gauge; AC, LPC4Z — 18 gauge; **ACHZ**, LPC6Z — 16 gauge; RTC — 14 gauge

Finish: Galvanized. Some products available in ZMAX® coating and stainless steel.

Installation:

- Use all specified fasteners; see General Notes
- Install all models in pairs, except RTC.
LPCZ — 2½" beams may be used if 0.148" x 1½" nails are substituted for 0.148" x 3" nails
ACHZ — Field-adjustable flanges for end-of-beam installations (bend one time only)

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

2. Connector table loads and fastener quantities are listed for two parts.

3. Lateral load is in the direction parallel to the beam.

4. For minimum nailing quantity and load values, fill all round holes; for maximum nailing quantity and load values, fill all round and triangular holes.

5. Uplift loads do not apply to spliced conditions. Spliced conditions must be detailed by the Designer to transfer tension loads between spliced members by means other than the post cap.

6. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.

7. **Fasteners:** Nail dimensions in the table are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

	Model No.	Dimensions (in.)		Total No. of Fasteners (in.)		DF/SP Uplift Loads (160)			SPF Uplift Loads (160)		
		W	L	Beam	Post	Side Beam	Main Beam	Post	Side Beam	Main Beam	Post
	RTC44 ¹ (Mitered corner)	3 ⁵ / ₁₆	4 ³ / ₄	(16) 0.162 x 3 ¹ / ₂	(10) 0.162 x 3 ¹ / ₂	900	900	1,800	775	775	1,550
	RTC44 ² (Square cut)	3 ⁵ / ₁₆	4 ³ / ₄	(16) 0.162 x 3 ¹ / ₂	(10) 0.162 x 3 ¹ / ₂	925	1,230	1,760	795	1,060	1,515
SS	LCE4 ¹ (Mitered corner)	5 ³ / ₈	5 ³ / ₈	(14) 0.162 x 3 ¹ / ₂	(10) 0.162 x 3 ¹ / ₂	—	—	885	—	—	760

1. The allowable download for the mitered RTC44 and LCE4 connection is limited to the bearing of the mitered beams on the post and shall be determined by the designer.

2. The allowable download for the main beam in the square-cut RTC44 connection is limited to the bearing of the beam on the post and shall be determined by the designer. The side beam allowable download is 1,170 lb.

3. The combined uplift loads applied to all the beams must not exceed the post allowable uplift load listed in the table.

4. **LCE4** connectors must be installed in pairs to achieve listed loads.

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

CBTZ™

Concealed Beam Tie

CBTZ, is part of the concealed structural connector line that combines structural strength with invisibility. Designed to connect horizontal beams atop a vertical post, the CBTZ continues the structural load path into the foundation through the CPTZ. The simplistic cylindrical design allows installations with a common drill bit, eliminating challenging kerf cuts. The CBTZ is available in two models designed to connect beams and posts of a variety of sizes. It is part of a concealed connector system that includes the CPTZ and CJT.

Features:

- Flattened sides assist installer while using the CBTZ as a template
- Locator tabs provide proper dimensional layout
- Required dowel pins included
- Orientation markings distinguish which end installs into the post and which end goes into the beam

Material: 12 gauge

Finish: CBT — ZMAX® coating; the ½"-diameter drift dowels are mechanically galvanized in accordance with ASTM B695, Class 55

Installation:

- Use all specified fasteners; see General Notes
- ½" dowels included
- CBTZ requires a minimum 6"-deep nominal beam
- For step-by-step installation instructions, see technical bulletin T-C-CBTZINS or view our video on strongtie.com

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

CBT4Z- KT	6x6	—	6x8	1 ¼	14	3	3	½" x 4 ¾" dowel	(4) ¼" x 6" SDS	4,215	1,655	18,140	—	—	—	

- Uplift and lateral loads have been increased for wind or earthquake loading, with no further increase allowed; reduce where other loads govern.
- Lateral load is in the direction parallel to the beam.
- Alternative ½"-diameter hex- or square-head machine bolts may be used for loads listed.
- All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect dowel or bolt installation into the wide face.

- See figure for placement of the additional SDS fasteners required for the splice connection.
- Dowels included in CBTZ kits do not match required lengths for the multi-ply application. The sizes shown in the table above need to be ordered separately or trimmed in the field.
- Built-up lumber (multiple members) must be fastened together to act as one to resist the applied load (excluding the connector fasteners). This must be determined by the designer.
- Center CBTZ on built-up beam. Loads are applicable to beam installation flush to one side of post or beam centered on post.

PCZ™/EPCZ™

Post Caps

PCZ/EPCZ post caps are designed with their post and beam flanges in-line so that one PCZ/EPCZ model can accommodate several post sizes. The PCZ/EPCZ uses 0.148" x 3" nails. An alternate choice of fastener is the #9 x 1 1/2" Strong-Drive® SD Connector screw. ZMAX® finish is standard to meet exposure conditions in many environments. See additional corrosion information at strongtie.com/info.

Material: 16 gauge

Finish: ZMAX coating

Installation:

- Use all specified fasteners; see General Notes
- Do not install bolts into pilot holes

Options:

- For end conditions, specify EPCZ post caps
- For heavy-duty applications, see CC/CCQ pp. 94–95/92–93 and ACHZ pp. 88–89
- For retrofit applications, see AC and LCE Series

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Uplift loads do not apply to spliced conditions. Spliced conditions must be detailed by the designer to transfer tension loads between spliced members by means other than the post cap.
3. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
4. Post and beam may consist of multiple members provided they are connected independently of the post cap fasteners.
5. 0.148" x 2 1/2" nails may be used with no load reduction for uplift and 0.85 of the table loads for lateral.
6. #9 x 1 1/2" Strong-Drive SD Connector screws may be substituted for table fasteners with no load reduction.
7. To order models available for rough size lumber, specify RZ suffix — e.g., PC4RZ.
8. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

EPCZ Post Cap Installed on Double 2x Members

PCZ Post Cap Installed on Double 2x Members

CCQ™/ECCQ™

Column Caps

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

Column caps provide a strong connection for column-beam combinations. This design uses Strong-Drive® SDS Heavy-Duty Connector screws to provide faster installation and provides a greater net section area of the column compared to bolts. The SDS screws provide for a lower profile compared to standard through bolts.

Material: CCQ3, ECCQ3, CCQ4, CCQ4.62, ECCQ4, ECCQ4.62, CCQ6, ECCQ6 — 7 gauge; all others — 3 gauge

Finish: Simpson Strong-Tie gray paint; available in HDG and stainless steel; CCOQ and ECCOQ — no coating

Installation:

- Install 1/4" x 2 1/2" Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the column cap. (Lag screws will not achieve the same load.) Install stainless-steel Strong-Drive screws with stainless-steel connectors.
- CCOQ and ECCOQ column caps only (no straps) may be ordered for field-welding to pipe or other columns. Dimensions are same as CCQ and ECCQ. Weld by designer.
- For rough-cut lumber sizes, provide dimensions. An optional W₂ dimension may be specified with any column size given. (Note that the W₂ dimension on straps rotated 90° is limited by the W₁ dimension.)

Options:

- For end conditions, specify ECCQ.
- Straps may be rotated 90° where W₁ ≥ W₂ and for CCQ5-6.
- Other custom column caps are available. Contact Simpson Strong-Tie.

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Downloads shall be reduced where limited by capacity of the post.
3. Uplift loads do not apply to spliced conditions. Spliced conditions must be detailed by the designer to transfer tension loads between spliced members by means other than the post cap.
4. Spliced conditions must be detailed by the designer to transfer tension loads between spliced members by means other than the column cap.
5. Column sides are assumed to be aligned in the same vertical plane as the beam sides. CCQ4.62 models assume a minimum 3 1/2"-wide post.
6. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
7. Beam depth must be a minimum of 7".
8. For 5 1/4" engineered lumber, use 5 1/2" models.
9. CCOQ and ECCOQ welded to a steel column will achieve maximum load listed for the beam and the post cap as CCQ and ECCQ. The steel column width shall match the beam width. Weld by designer.

CC/ECC/ECCU

Column Caps

Column caps provide a strong connection for column-beam combinations.

Material: CC3¼, CC44, CC46, CC48, CC4.62, CC64, CC66, CC68, CC6-7½, ECC3¼, ECC44, ECC46, ECC48, ECC4.62, ECC64, ECC66, ECC68, ECC6-7½ — 7 gauge; all others — 3 gauge

Finish: Simpson Strong-Tie gray paint. Some products available in HDG, stainless steel or black powder coat; CCO, ECCO — no coating.

Installation:

- Use all specified fasteners; see General Notes
- Bolt holes shall be a minimum of ½" to a maximum of ⅞" larger than the bolt diameter (per 2015/2018 NDS, section 12.1.3.2)
- Contact engineered wood manufacturers for connections that are not through the wide face

Options:

- Straps may be rotated 90° where $W_1 \geq W_2$ (see illustration) and for CC5¼-6.
- For special, custom or rough-cut lumber sizes, provide dimensions. An optional W_2 dimension may be specified. (The W_2 dimension on straps rotated 90° is limited by the W_1 dimension.)
- CCO/ECCO — Column cap only (no straps) may be ordered for field-welding to pipe or other columns. CCO/ECCO dimensions are the same as CC/ECC. Weld by designer.
- CCOB — Any two CCOs may be specified for back-to-back welding to create a cross beam connector. Use the table loads; the load is no greater than the lesser element employed.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Downloads shall be reduced where limited by allowable loads of the post.
3. CC uplift loads do not apply to splice conditions.
4. Splice conditions with CCs must be detailed by the designer to transfer tension loads between spliced members by means other than the column cap.
5. Column sides are assumed to be aligned in the same vertical plane as the beam sides. CC4.62 models assume a minimum 3 1/2"-wide post.
6. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
7. Beam depth must be at least as tall as H₁.
8. CCO and ECCO welded to a steel column will achieve maximum load listed for the beam and the post cap as CC and ECC. The steel column width shall match the beam width. Weld by designer.
9. All references to bolts are for structural quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

ECCLQ/CCCQ/CCTQ

Column Caps

The ECCLQ, CCCQ and CCTQ column caps provide strong, multiple beam-to-column connector options. The design uses Strong-Drive® SDS Heavy-Duty Connector screws to provide faster installation and a lower profile compared to standard through bolts. Screws are configured to provide high uplift design values.

Material: CCCQ3, ECCLQ3, CCTQ3, CCCQ4, ECCLQ4, CCTQ4, CCCQ4.62, ECCLQ4.62, CCTQ4.62, CCCQ6, ECCLQ6, CCTQ6 — 7 gauge; all others — 3 gauge

Finish: Simpson Strong-Tie gray paint; also available in HDG

Installation:

- Install 1/4" x 2 1/2" Strong-Drive SDS Heavy-Duty Connector screws, which are provided, in all round holes. (Lag screws will not achieve the same load.)
- No additional welding is allowed.

Options:

- Many combinations of beam and post sizes can be manufactured; use [Post-to-Beam Selector web application at app.strongtie.com/pbs](https://app.strongtie.com/pbs) to specify dimensions for ordering.
- Available in widths up to 8" wide.
- ECCLQ is available in left or right side beam orientations. Specify ECCLLQ or ECCLRQ.
- Straps may be rotated where $W_1 \geq W_2$.
- Column caps may be ordered without the column straps for field welding to a steel column, full loads apply for the beam and the post cap. Specify "No Straps" when ordering. Weld by designer. These models have no coating.

Ordering:

- The L dimension varies depending on the width of the side stirrup (W_3 or W_4). Contact Simpson Strong-Tie for exact dimensions.
- Main beam stirrup height (H_1) is 7". Side beam stirrups (H_2 or H_3) can vary in height with the minimum height of 7". Specify the side stirrup height from the top of the cap.
- Example Order: 4x main beam, 6x post, 4x side beam (oriented to the left) with both beams flush on bottom is ordered as an ECCLLQ464SDS.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

Series	DF/SP Allowable Loads					Code Ref.
	Uplift (160)			Download (100)		
	Main Beam	Side Beam	Total	Side Beam	Total	
ECCLQ-SDS	2,835	1,840	3,795	6,780	Refer to note #5	—
CCCQ-SDS	4,780	2,390	4,780	7,000		
CCTQ-SDS	4,910	2,350	5,315	7,000		

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Allowable load is per seat. Side beams must be loaded symmetrically for the CCCQ.
3. The combined uplift loads applied to all beams in the connector must not exceed the total allowable uplift load listed in the table.
4. The ECCLQ side beam may use a side beam uplift load up to 2,350 lb. The deflection of this load may exceed the standard 1/8" deflection by an additional 1/8".
5. The combined download for all the carried beams shall not exceed the allowable download for the unmodified product on p. 93 (CCQ load for CCCQ and CCTQ, or ECCQ load for ECCLQ). The download for each side beam shall not exceed the allowable load shown.
6. Column width in the direction of the beam width must be the same as the main beam width (W_1).

ECCL/CCC/CCT

Column Caps

Column-to-beam connections often have multiple beams framing on top of a column. L, T, and cross-column caps provide design solutions for this application.

Material: 7 gauge or 3 gauge depending on size

Finish: Simpson Strong-Tie gray paint; also available in HDG

Installation:

- Use all specified fasteners; [see p. 95 for bolt size and quantity](#)
- Bolt holes shall be a minimum of $\frac{1}{32}$ " to a maximum of $\frac{1}{16}$ " larger than bolt diameter (per 2015 and 2018 NDS 12.1.3.2)

Options:

- Many combinations of beam and post sizes can be manufactured.
- The download shall be determined from the allowable loads for the unmodified product (see p. 95). The side beam can take a maximum of 40% of the download and shall not exceed 10,665 lb. The sum of the loads for the side beam(s) and main beam can not exceed the table load.
- Uplift loads do not apply for ECCL caps. For CCC and CCT, uplift loads from table apply for main beam only.
- The column width in the direction of the main beam width must be the same as the main beam width (W_1).
- Specify the stirrup height from the top of the cap. The minimum side stirrup heights (H_2 or H_3) is $6\frac{1}{2}$ " ($3\frac{1}{2}$ " for 44s).
- The L dimension may vary depending on the width of the side stirrup (W_3 or W_4).
- See p. 95 for other dimensions.
- Column caps may be ordered without the column straps for field welding to a steel column. Specify "No Straps" when ordering. Weld by designer. Full loads apply for the beam and the post cap.

Ordering Examples:

- A CCC66 with $W_3 = 5\frac{1}{2}$ ", H_2 and $H_3 = 6\frac{1}{2}$ " is a CC66 column cap with $5\frac{1}{2}$ " beams on each side with all beam seats flush.
- An ECCLR66 with $W_3 = 3\frac{5}{8}$ ", $H_2 = 7\frac{1}{2}$ " is an ECC66 end column cap with a 4x beam on the right side (specify direction left or right for stirrup) and stirrup seat 1" below the cap seat.

Web Applications: Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

There are cost-effective alternatives for replacing column caps by using a combination of connectors. Designer must specify the options required. For column cap clearance, allow 3" for the hanger flange depth.

Hanger Load Table Explanation

SD This icon identifies products approved for installation with Simpson Strong-Tie Strong-Drive® SD Connector screw. See pp. 362–366 for more information.

Min./Max.: Refers to min. or max. nailing for products with round and triangle holes. Min. nailing uses round holes, and max. nailing uses round and triangle holes to achieve maximum load.

Load Duration: Assumed duration factor used to determine the allowable load.

Installed Cost Index: This indicates the products relative installed cost (combined cost and installation cost).

Allowable Design Loads: The maximum load that a connection is designed to provide.

Joist Size: This shows the size of joist member.

Model No.: This is the Simpson Strong-Tie product name.

Gauge: Product material thickness.

Nails: This shows the fastener quantity and type required to achieve the table loads.

		14	3⅜	5⅝	2½	Max.	(12) 0.162 x 3½	(6) 0.148 x 3	1,135	1,785	2,015	2,165	+254%		

This icon identifies products that are available with additional corrosion protection. See p. 16 for additional information.

Dimensions W, H, B: This shows the product dimensions (width, height and bearing length in this case.) referenced in the product drawing.

Fasteners: Nail dimensions are listed diameter by length. See pp. 23–24 for other nail sizes and information.

Throughout this catalog, the table fastener size indicates the required nail diameter and length. See pp. 23–24 for load adjustment factors for alternative fasteners used with some connectors.

All installations should be designed only in accordance with the allowable load values set forth in this catalog.

Code Ref.: See p. 13 for the Code Reference Key Chart, to determine which code reports include this product.

Product Drawing: Provides a graphic presentation of the product with dimensional information (often cross referenced to the table).

Specify joist-to-beam connections by visiting app.strongtie.com/hs to access our Hanger Selector web application.

Hanger Installation Notes

Illustrations shown on pp. 99–100 apply to solid sawn lumber as well as I-joist and structural composite lumber.

Top-Flange Hangers

Flush Framing

Top flange configuration and thickness of top flange need to be considered for flush frame conditions.

Hanger Over-Spread

If the hanger is over-spread, it can raise the I-joist above the header and may cause uneven surfaces and squeaky floors. The ITS and IUS with up to ¼" overspread (both sides combined) will not result in reduced download. It will reduce allowable uplift load.

Hanger Not Plumb

A hanger "kicked-out" from the header can cause uneven surfaces and squeaky floors.

Prevent Rotation

Hangers provide some joist rotation resistance; however, additional lateral restraint may be required for deep joists.

No Rotation Resistance

Lack of web stiffeners combined with short hanger allows unwanted rotation.

Rotation Prevented by Web Stiffeners or Solid Joist and Hanger Height

Hanger height should be at least 60% of the joist height.

Rotation Prevented by Web Stiffeners or Solid Joist and Clips or Blocking

If hanger height is less than 60% of the joist height, add clips or blocking near the top.

Rotation Prevented by Lateral Flange Support

Sides of hanger laterally support the top flange of the I-joist. No web stiffeners required.

Wood Nailers

Correct Attachment

Nailer Too Wide

The loading may cause cross-grain bending. As a general rule, the maximum allowable overhang is ¼", depending on nailer thickness.

Nailer Too Narrow

Nailer should be full width.

Nailer Too Thin

Or the wrong hanger for the application.

Hanger Installation Notes

Toe-Nailing

Toe nailing causes squeaks and improper hanger installations. Do not toe nail I-joists before installing top-flange or face-mount hangers.

Positive Angle Nailing

Correct Nailing
Approx. 45° Angle

Nail Too Long

Nail at Wrong Angle

Other Applications

Sloped Joists

For sloped joists up to 1/4:12 there is no reduction. For slopes greater than 1/4:12 see individual product pages or refer to technical bulletin T-C-SLOPEJST at strongtie.com.

Multiple Joists

Multiple joists should be adequately connected together to act as one unit.

Fasteners

Use the correct nails. Wood may split if the nails are too large. Hanger nails into flanges should not exceed 0.148" x 1 1/2". Nails into web stiffeners should not exceed 0.162" diameter.

Eccentrically Loaded I-Joists

Supporting a top flange hanger may require bottom flange restraining straps, blocking or directly-applied ceiling systems to prevent rotation at the hanger location.

Skewed Joists

Joists may be skewed up to 2.5° in a non-skewed hanger without any load reduction. Refer to individual hanger descriptions for information allowing any further skew applications.

Notching Joists

Notching of joists/rafters (or kerf cutting) to accommodate sloped conditions in standard (non-sloped) hangers is not recommended and can lead to premature splitting.

Do Not Notch Joist

I-Joist as a Header Installation

When face-mount hangers are attached to I-joist headers, backer blocks must be installed to provide a nailing surface for the hanger nails. The backer blocks should be installed on both sides of the web and attached together with a minimum of (10) 0.148" x 3" nails. The hanger nails should extend through the web. Contact the I-Joist manufacturer for additional design considerations.

Face-Mount Hanger

When top-flange hangers are attached to I-joist headers, a backer block must be installed to prevent the top flange from rotating under load. The backer blocks should be installed with a minimum of (10) 0.148" x 3" nails clinched. Check with the joist manufacturer for additional design considerations.

Top-Flange Hanger

When ordering, specify low side flush, center flush or high side flush.

Hanger Options General Notes

Hanger Options

The Hanger Options Matrix for Face Mount and Top Flange Hangers in each of the respective hanger sections shows hanger modifications and special applications (uplift, nailers and weldability) that are available for each model series. Modifications may not be available for all models in the series, and some combinations of hanger options are not available. Many hanger modifications result in load reductions. For all modifications, refer to the listed hanger option pages for additional information regarding the availability of each

modification, associated load reductions, and installation requirements. For joists sloped up to ¼:12, there is no load reduction. For slopes greater than ¼:12, see individual product pages or refer to technical bulletin T-C-SLOPEJST at strongtie.com. For more information regarding the applications, refer to the individual product pages throughout the catalog.

For attaching to headers made up of multiple plies, refer to technical bulletin T-C-MPLYHEADR at strongtie.com.

Hanger Option General Notes

This information applies only to the hangers manufactured by Simpson Strong-Tie and installed per our instructions. Some combinations of these options on a single hanger have not been evaluated. In some cases, combinations of these options cannot be manufactured. A qualified designer must always evaluate each connection, including header and joist limitations, before specifying the product.

Testing is performed using a standardized hanger test method. The joist in the test setup may include the minimum amount of structural stability where appropriate. For example, the sloped down hanger tests are assembled with a joist cut on the lower end to lie flush with a wood member attached with three 8d common toenails. Header and other attached structural members are assumed fixed in actual installations. Horizontal loads induced by sloped joists must be resisted by other members in the structural system.

Material: Gauge may vary from that specified depending on the manufacturing process used. U, HU, HUTF, WP and BA hangers normally have single-piece stirrups; occasionally, the seat may be welded. Hanger configurations, height and fastener schedules may vary from the tables depending on the joist size, skew and slope.

Finish: See specific hanger tables. Welded specials: Simpson Strong-Tie gray paint. Specials that are not galvanized before fabrication can be hot-dip galvanized after fabrication; specify HDG.

Codes: Modified hangers, due to their numerous variations, are not on code reports.

Loads: For multiple modifications on the same connector, use the single multiplier factor that yields the lowest design loads.

To Order: Use the abbreviations below to order specials. The example shows a HWP3.56X hanger and illustrates most available options; most special hangers have only a few of these features. For assistance, contact Simpson Strong-Tie.

Installation:

- Fastener quantities may be increased beyond the amount specified in the standard hanger table.
- Fill all holes with the table-specified fastener types.
- Some skewed hangers require bevel cut joists; refer to the specific notes provided for each product.

HWP3.56	X	H ₁ = Specify	SLD30	SKL20	TFDL20	TFO20	OSR
Base Model		Height	Seat Sloped Down (30°) (SLU = Seat Up)	Skewed Left (20°) (SKR = Skewed Right)	Top Flange Down Left (20°) (TFDR = Top Flange Down Right)	Top Flange Open (20°) (TFC = Top Flange Closed)	Offset Top Flange Right (OSL = Offset Top Flange Left)
X = Modification							

The Simpson Strong-Tie Hanger Selector enables you to select the optimal product for your project. Visit app.strongtie.com/hs to access the Hanger Selector web application that takes into consideration all the characteristics seen in this catalog.

Height for Sloped Hangers

Height 1 (H₁) is the joist height before the slope cut has been made.

Net Height (Net H) is the joist height after the slope cut has been made.

Provide **H₁** when ordering a connector. Connectors are made assuming dry lumber is being used in continuously dry conditions.

Simpson Strong-Tie will calculate the **Net H** dimension based on the mathematical formula of H_1/\cos angle.

LUC/LU/U/HU/HUC

Standard Face-Mount Joist Hangers

LUC — Concealed-flange hanger available for 2x6, 2x8, 2x10 and 2x12 lumber. Ideal for end of ledger/header or post conditions, the LUCZ also provides cleaner lines for exposed conditions such as overhead decks.

LU — Value engineered for strength and economy. Precision-formed — engineered for installation ease and design value.

U — The standard U hanger provides flexibility of joist to header installation. Versatile fastener selection with tested allowable loads.

HU/HUC — Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails. These heavy-duty connectors are designed for additional strength, longevity and safety factors.

Material: See tables on pp. 108–118

Finish: Galvanized. Some products available in ZMAX® coating or stainless steel.

Installation:

- Use all specified fasteners; see General Notes.
- HU/HUC — Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- Joists sloped up to ¼:12 achieve table loads.
- For installations to masonry or concrete see pp. 253–255.
- HU/HUC hangers can be welded to a steel member. Allowable loads are the lesser of the values in the hanger tables on pp. 108–118 or the weld capacity — refer to technical bulletin T-C-HUHUC-W at strongtie.com.
- When nailing into solid sawn carrying member's end grain, the allowable load is adjusted by a factor of 0.67.

Allowable Loads:

- See table on pp. 108–118 for loads.

Options:

- For both flanges concealed, order HUC.
- When the HUC is skewed, the header flange opposite the skew direction is not concealed. See p. 105.
- For low-cost, code approved 45° skewed hangers, see SUR/SUL.
- For field-adjustable hangers, see LSSJ, LRUZ and LSSR on pp. 120–124.
- See modifications table for available options and associated load capacities for U and HU hangers.
- For ease of ordering, refer to technical bulletin T-C-U-HU-WS at strongtie.com.
- LU/LUC cannot be modified.

Web Applications:

Visit app.strongtie.com/hs to access our Hanger Selector web application.

LUC/LU/U/HU/HUC

Standard Face-Mount Joist Hangers (cont.)

U/HU/HUC Series Modifications and Associated Load Reduction Factors

Seat			Flange	Fastener Substitutions			
Seat Sloped Up or Down 45° Max.	Seat Skewed 67½° Max. ³ for W ≤ 6 45° Max. for W > 6	Seat Sloped and Skewed	One or Both HU Flanges Concealed ²	For Stainless-Steel Hangers Stainless-Steel Nails 0.162" x 3½"		Other Smooth-Shank Fastener Substitutions	
1.00	W ≤ 3⅝ use 1.00 W > 3⅝ use 0.80	0.80	1.00 (normal) 0.80 (when sloped and skewed)	Ring shank (all conditions)	1.00	0.162" x 3½" → 0.162" x 2½"	1.00
				Smooth shank (normal seat)	1.00	0.162" x 3½" → 0.148" x 3"	0.84
				Smooth shank (modified seat) ¹	0.50	0.162" x 3½" → 0.148" x 1½"	0.64

1. Modified seat is sloped, skewed, or both. For stainless-steel hangers, if sloped only or skewed only, use a smooth-shank stainless-steel reduction of 0.65.

2. For hanger applications with both flanges concealed, W must be at least 2⅝". To order, ask for HUCXXX.

For skewed HUC, only flange on acute side is concealed.

3. Skews over 50° require a square-cut joist.

Reduction Factor Instructions

Allowable Download = Seat x Flange x Stainless Steel Nails x Other Fastener Substitutions x Table Load

Allowable Uplift = 0.75 x Face Fastener Type x Table Load for skewed or sloped

1.00 x Face Fastener Type x Table Load for non-skewed or non-sloped

LUS/HUS/HHUS/HGUS™

Double-Shear Face-Mount Joist Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

All hangers in this series have double-shear nailing. This innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation and the use of standard nails for all connections. (Do not bend or remove tabs.)

Material: See tables, pp. 108–118

Finish: Galvanized. Some products available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes.
- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.
- With 3x carrying members: when 0.162" x 3½" nails are specified, use 0.162" x 2½" nails into the header and 0.162" x 3½" nails into the joist with no load reduction. When 0.148" x 3" nails are specified, use 0.148" x 2½" nails into the header and 0.148" x 3" nails into the joist with no load reduction.
- With 2x carrying members: when 0.162" x 3½" nails are specified, use 0.148" x 1½" nails into the header and 0.148" x 3" nails into the joist and reduce the load to 0.64 of the table values. When 0.148" x 3" nails are specified, use 0.148" x 1½" nails into the header and 0.148" x 3" nails into the joist and reduce the load to 0.77 of the table values. See p. 24 for specific Load Adjustment Factors.

Allowable Loads:

- See table on pp. 108–118 for loads.

Options:

- LUS/HUS hangers cannot be modified.
- See next page for HHUS/HGUS modifications.

LUS/HUS/HHUS/HGUS™

Double-Shear Face-Mount Joist Hangers (cont.)

HHUS/HGUS

HHUS — Sloped and/or Skewed Seat

- HHUS hangers can be skewed to a maximum of 45° and/or sloped to a maximum of 45°
- For skew only, maximum allowable download is 0.85 of the table load
- For sloped only or sloped and skewed hangers, the maximum allowable download is 0.65 of the table load
- Uplift loads for sloped/skewed conditions are 0.72 of the table load, not to exceed 2,475 lb.
- The joist must be bevel-cut to allow for double-shear nailing

HGUS — Skewed Seat

- HGUS hangers can be skewed to a maximum of 45°. Allowable load adjustment factors are:

HGUS Seat Width	Carried Member End Condition			
	Square Cut		Bevel Cut	
	Uplift	Download	Uplift	Download
$W < 2"$	0.46	0.62	0.46	0.72
$2" < W < 6"$	0.41	0.46	0.41	0.85
$6" < W < 6\frac{3}{4}"$		0.40		
$6\frac{3}{4}" < W < 7\frac{1}{4}"$	Not allowed	Not allowed

HUCQ

Heavy-Duty Face-Mount Joist Hanger

The HUCQ series are heavy-duty joist hangers that incorporate Strong-Drive® SDS Heavy-Duty Connector screws. Designed and tested for installation at the end of a beam or on a post, they provide a strong connection with fewer fasteners than nailed hangers. See pp. 156–162 for structural composite lumber hangers.

Features:

- Fire-resistant F (flame) and T (temperature) rated in Intertek Design No. SST/WPCF 120-01.

Material: 14 gauge

Finish: Galvanized. Most models available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes.
- Install 1/4" x 2 1/2" Strong-Drive SDS Heavy-Duty Connector screws, which are provided, in all round holes. (Lag screws will not achieve the same load.)
- HUCQ hangers can be welded to a steel member. Allowable loads listed in hanger tables on pp. 109–112 and 114–117 apply when installed with minimum (6) 1" welds. See technical bulletin T-C-HUHUC-W at strongtie.com for weld information.

Allowable Loads:

- See tables on pp. 109–112 and 114–117 for loads.

Options:

- These hangers cannot be modified.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

Face-Mount Hangers — Solid Sawn Lumber (DF/SP)

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- For minimum nailing quantity and load values, fill all round holes; for maximum nailing quantity and load values, fill all round and triangular holes.
- DF/SP loads can be used for SCL with an equivalent specific gravity of 0.50 or greater.
- Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie **Hanger Selector** web application includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.
- Hangers with an "*" do not have an Installed Cost Index.

Codes: See p. 13 for Code Reference Key Chart

Specify joist-to-beam connections by visiting app.strongtie.com/hs to access our Hanger Selector web application.

Face-Mount Hangers — Solid Sawn Lumber (SPF/HF)

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Face-Mount Hangers — Solid Sawn Lumber (SPF/HF)

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- For minimum nailing quantity and load values, fill all round holes; for maximum nailing quantity and load values, fill all round and triangular holes.
- DF/SP loads can be used for SCL with an equivalent specific gravity of 0.50 or greater.
- Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie **Hanger Selector** web application includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Specify joist-to-beam connections by visiting app.strongtie.com/hs to access our Hanger Selector web application.

Face-Mount Hangers — Rough Lumber (DF/SP)

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. DF/SP loads can be used for SCL with an equivalent specific gravity of 0.50 or greater.

3. HU hangers can be ordered in rough sizes at full table loads. Add "X" to the model designation (e.g., HU28X) and specify rough width or height. Maximum width 8".

4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. DF/SP loads can be used for SCL with an equivalent specific gravity of 0.50 or greater.

3. HU hangers can be ordered in rough sizes at full table loads. Add "X" to the model designation (e.g., HU28X) and specify rough width or height. Maximum width 8".

4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Stair Cassette Ledger Connector

The latest in our line of offsite construction solutions, the code-listed SCLC stair cassette ledger connector offers a safer and more efficient way to field-attach preassembled stair cassettes to floor cassette headers. It installs on the floor cassette header in the factory with power-driven or hand-installed nails, and is fastened with Strong-Drive® SDS Heavy-Duty Connector screws on the jobsite once the cassette is securely seated.

Feature:

- Factory installation of connector on floor cassette header reduces onsite labor demand
- Stair cassette seats securely on connector for safer onsite installation
- Precise onsite fit-up tolerance
- Uses power-driven or hand-installed nails and SDS Heavy-Duty Connector screws
- Can be installed in conjunction with the LSCZ stair stringer connector, see pp. 308–309

Material: 14 gauge

Finish: G90 galvanized

Installation:

- Use all specified fasteners; see General Notes
- In the factory, attach the SCLC to the header of the floor cassette. A minimum of two SCLC connectors shall be used to support a stair cassette.
- In the field, crane the stair cassette into place so that the stair cassette ledger engages all supporting SCLC connectors.
- Complete the installation with all specified field-installed SDS fasteners as shown in the installation images.
- **Codes:** See p. 13 for Code Reference Key Chart

Model No.	Supported Ledger Thickness (in.)	Dimensions (in.)			Fastener Schedule		Allowable Download (100/115/125)		Code Ref.
		W	B	H	Header	Ledger / Header	DF/SP	SPF/HF

1. When cross-grain tension cannot be avoided in the member, mechanical reinforcement to resist such forces shall be considered by the designer.
2. **Fasteners:** Nail dimensions are listed diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive Heavy Duty Connector screws. See pp. 23–24 for fastener information.

LRUZ**Face-Mount Rafter Hanger**

The LRUZ offers an economic alternative for those applications requiring a sloped hanger for rafter-to-ridge connections. Used with solid sawn rafters, the LRUZ's unique design enables the hanger to be installed either before or after the rafter is in place. The field-adjustable seat helps improve job efficiency by eliminating mismatched angles in the field and lead times associated with special orders. The LRUZ offers comparable or better load capacity to other rafter hangers at a reduced cost while using fewer fasteners.

Features:

- The open design and ability to field-adjust the slope make the LRUZ ideal for both retrofit or new applications.
- May be sloped down from 0° (0:12 pitch) to 49° (14:12). For slopes greater than 45°, allowable downloads are 0.85 of table loads.
- May be sloped up from 0° to 45°.
- For added versatility, the fasteners on the face of the hanger are placed high enabling the bottom of the rafter to hang below the ridge beam (see "Max. C₁" dimension).
- Can be installed using nails or Strong-Drive® SD Connector screws.

Material: 18 gauge**Finish:** ZMAX® coating**Installation:**

- Use all specified fasteners; see General Notes
- Joist fasteners must be installed at an angle through the rafter or joist into the header to achieve the table loads
- See alternate installation on p. 121 for retrofit applications

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Allowable loads are based on a minimum 3" carrying member. For single 2x carrying members, use 0.148" x 1¹/₂" nails in the face and 0.148" x 3" in the joist, and reduce the allowable load to 0.81 of the tabulated value for 0.148" x 3" nails. Alternatively, use #10 x 1¹/₂" Strong-Drive SD Connector screws in the face and #10 x 2¹/₂" SD Connector screws in the joist as shown in the table.
3. **Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

LRUZ

Face-Mount Rafter Hanger (cont.)

Alternate Installation for Retrofit Applications

When an existing roof deck prevents the horizontal installation of fasteners, #10 x 2½" Strong-Drive® SD Connector screws may be installed sloped upward to match the roof pitch (49° max.). Use table values for an installation with 0.148" x 3" nails when Strong-Drive SD Connector screws are sloped. Nails may not be installed sloped upward.

Alternate Installation for Retrofit

Model No.	Angled Fasteners		DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.

- Minimum ridge beam depths shown assume that the rafter and the ridge beam are flush at the top.
- Minimum ridge beam depths have been determined to ensure the maximum C₁ dimension for the LRU is not exceeded. Deeper ridge beams may be required to support the rafter loads as determined by the designer.
- Per the 2012/2015/2018/2021 IRC® Section R802.3 the ridge is required to be not less in depth than the cut end of the rafter unless the ridge is designed as a beam.
- Slopes greater than 12:12 are download only.

Installation on Minimum Depth Beam
(see footnote 3 at left)

LSSR™

Slopeable/Skewable Rafter Hanger

The patent-pending LSSR light slopeable/skewable rafter hanger is the next generation of field-adjustable rafter hangers. One of its key features is that it can be installed after the rafter has been tacked into place. A versatile hanger, it is field adjustable for skews up to 45° and features an innovative hinged swivel seat which adjusts up to a 45° slope. New models are now available for 2x lumber.

Features:

- Makes it possible to install after the rafters are already in place
- Flange design allows for easy skew (left or right) adjustment, from 0° to 45°
- Swivel seat adjusts easily from 0° to 45° up or down

Material: See table

Finish: ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes
- Limit on-center spacing of rafters and joists with LSSR210-2Z and LSSR410Z to 14" o.c. minimum; for the LSSR26Z, LSSR28Z and LSSR210Z, limit on-center spacing to 8" o.c. minimum.
- For a common rafter:
 - Slide hanger into position; adjust seat and install seat nails
 - Make sure side stirrups are snug close to the joist, bend lines are plumb
 - Install a face nail on each side to hold in place
 - Install all round and obround holes on the header and joist
- For jack rafters:
 - Fold acute side forward
 - Slide hanger into position; adjust seat and install seat nails
 - Make sure hanger is snug close to the joist, bend line is plumb
 - Install obround nails on acute side, both header and joist
 - Make sure hanger is snug close to the joist and header; bend line is plumb
 - Install joist nails on obtuse side
 - Bend obtuse side flange back so that header flange is flush against header
 - Install header nails

Face-Mount Adjustable Light Slopeable/Skewable Jack Hanger

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The innovative LSSJ is ideal for connecting jack rafters to hip members. Featuring a one-sided connection point for ease of installation and a versatile, hinged seat, the LSSJ is easily field adjustable to all typical rafter slopes ranging from 0:12 to 12:12. The LSSJ's header flange allows for easy skew adjustment, from 0° to 45°. It ships pre-bent at 45° so is ready to place for most typical applications. Specify left (L) or right (R) model when ordering.

Features:

- Hanger installs from one side with all fastener holes easily accessible
- Can be installed as a retrofit
- Seat grip makes setting the hanger quick and easy
- Accommodates roof pitches from 0:12 to 12:12
- Swivel seat adjusts easily and provides more support to joist, allowing for a higher load than fasteners alone

Material: 18 gauge

Finish: ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes
- For LSSJ26 an extra nail in the seat at load durations (115) and (125) adds 75 lb. to the 0.148" x 1 1/2" nails table downloads
- Joist end needs to be bevel cut
- Table and illustration shows left and right skews LSSJR/L (LSSJR = skewed right; LSSJL = skewed left)

Codes: See p. 13 for Code Reference Key Chart

SUR/SUL/HSUR/HSUL

Skewed 45° Face-Mount Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The SU and HSU series of hangers are skewed 45° left or right. Angled nail slots direct nails for proper installation.

Material: SUR and SUL — 16 gauge; HSUR and HSUL — 14 gauge

Finish: Galvanized. Some products available in ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes
- These hangers will normally accommodate a 40° to 50° skew
- Illustration shows left and right skews SUR/L (SUR = skewed right; SUL = skewed left)
- The joist end may be square cut or bevel cut

Options:

- Available with the A₂ flange turned in on the 2-2x and 4x models only (see illustration)
- To order, add "C" (for concealed) to the product name
- For example, specify HSURC46, HSULC46, SURC46, or SULC46

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

HSULC
Available for 2-2x and 4x models only

Typical SUR410 Installation

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
3. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie [Hanger Selector web application](http://app.strongtie.com/hs) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

HRC/HHRC™

Hip-Ridge Face-Mount Connectors

HRC is a field slopeable connector that attaches hip roof beams to the end of a ridge beam. The HRC may be sloped downward a maximum of 45°.

HHRC accommodates higher loads and uses Strong-Drive® SD Connector screws.

Material: HRC22 — 16 gauge; HHRC — 12 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners (included with HHRC); see General Notes.
- On end of ridge — use optional diamond holes on HRC22 to secure the HRC. Bend face flanges on HRC22 back flush with ridge, and complete nailing.
- HRC22 on face of ridge — adjust to correct height and install nails.
- Double bevel-cut hip members to achieve full bearing capacity with HRC.

Codes: See p. 13 for Code Reference Key Chart

VPA

Variable-Pitch Connector

The VPA may be sloped in the field, offering a versatile solution for attaching rafters to the top plate. It will adjust to accommodate slopes between 3:12 and 12:12, making it a complement to the versatile LSSR and LSSJ hangers. This connector eliminates the need for notched rafters, beveled top plates and toe nailing.

Material: 18 gauge

Finish: Galvanized

Installation: Use all specified fasteners; see General Notes

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.

2. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

VPA Installation Sequence

Step 1

Install top nails and face PAN nails in "A" flange to outside wall top plate.

Step 2

Seat rafter with a hammer, adjusting "B" flange to the required pitch.

Step 3

Install "B" flange nails in the onbround nail holes, locking the pitch.

Step 4

Install 0.148" x 1½" nail into tab nail hole. Hammer nail in at a slight angle to prevent splitting.

HCP

Hip Corner Plate

The HCP connects a rafter or joist to double top plates at a 45° angle.

Material: 18 gauge

Finish: HCP2 — galvanized or ZMAX® coating; HCP4Z — ZMAX coating

Installation: • Use all specified fasteners; see General Notes.

- Attach HCP to double top plates; birdsmouth not required for table uplift loads but may be required for download.
- Install rafter and complete nailing. Rafter may be sloped to 45°.

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

Member Size	Model No.	Fasteners (in.)		DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
		To Rafters	To Plates	(160)		(160)		
				Uplift	F ₁	Uplift	F ₁	
2x	HCP2	(6) 0.148 x 1½	(6) 0.148 x 1½	590	255	510	220	IBC, FL, LA
4x	HCP4Z	(8) 0.148 x 3	(8) 0.148 x 3	990	230	850	200	

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. The HCP can be installed on the inside and the outside of the wall with a flat bottom chord truss and achieve twice the allowable load.
3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical HCP Installation

Light and Heavy-Duty Concealed Joist Ties

The CJTZ/HJTZ are concealed connectors. They can be installed three ways: with no routing of header/post or beam; a routed header/post, or a routed beam. It is part of a concealed connector system that includes the CPTZ and CBTZ.

The HCJTZ is a heavy concealed beam tie to be used with large glulam beams resisting heavy loads. The HCJTZ features a unique shape that allows installers to insert the connector into the end of the beam without a visible slot cut into the bottom of the beam.

Material: CJTZ — 12 gauge; HCJTZ — 10 gauge

Finish: ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes.
- The CJTZ/H CJTZ is supplied with all dowels and screws required. Screws require a hex-head driver.
- Router end of beam for screw heads for flush installation.
- The carried member may be sloped up or down to 45° with full table loads.
- The CJTZ only is available with two dowel lengths. To order: specify short (e.g. CJTZS) or long dowels (e.g. CJTZL) (see footnote #1 below).

Options:

- See technical bulletin T-C-CJTZ at **strongtie.com**
- For additional concealed beam connections, see *Mass Timber Construction* catalog at **strongtie.com**

Codes: See p. 13 for Code Reference Key Chart

Chamfered
Steel Dowel
(galvanized)

Typical CJTZ Installation
(dowels should be centered in beam; HCJTZ similar)

Warning: This connector requires special attention to ensure correct installation. The beam must be installed perpendicular to the support member. The connection's components may be damaged if the beam is rotated from its opposite end during or after installation. Damaged components may not be noticeable and may reduce the connector's load carrying capacity.

These products are available with additional corrosion protection. For more information, see p. 16.

1. Center dowel in beam. Short dowel ($\frac{1}{2}" \times 2\frac{3}{4}"$) is for use with $3\frac{1}{2}"$ glulam beam, 4x sawn lumber, or $3\frac{1}{2}"$ wide PSL. Long dowel ($\frac{1}{2}" \times 4\frac{3}{4}"$) is for use with $5\frac{1}{2}"$ glulam beam, 6x sawn lumber, or greater widths.
2. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive® SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Typical HCJTZ Installation

JB/JBA/LB/LBAZ/BA/HB

Joist, Beam and Purlin Top-Flange Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The LBAZ and JBA hangers provide higher loads for 2x10, 2x12 and 2x14 members in 14-gauge and 18-gauge steel, respectively. The nail locations on the JBA enable effective use with nailers.

The BA hangers are cost-effective hangers featuring min./max. joist nailing option. Min. Nailing featuring Positive Angle Nailing targets moderate load conditions whereas the Max. Nailing generates capacities for higher loads. The unique two-level embossment provides added stiffness to the top flange. See tables on pp. 136–140. See Hanger Options on pp. 102–103 for hanger modifications, which may result in reduced loads.

Material: JB/JBA — 18 gauge; LB/LBAZ — 14 gauge; BA — 14 gauge or 12 gauge; HB — 10 gauge

For modified hangers, gauge may increase from that specified for non-modified hangers. Hanger configurations, height and fastener quantity may increase from the tables depending on joist size, skew and slope. Embossments may be omitted.

Finish: BA, HB, JB, JBA, LB and LBAZ — galvanized; BA, HB and LB may be ordered hot-dip galvanized; specify HDG.

Installation:

- Use specified fasteners; see General Notes and nailer table notes.
- LB, LBAZ, HB and BA may also be welded to steel headers with weld size to match material thickness. The minimum required weld to the top flanges is 2" (1 1/8" for LBAZ) fillet weld to each side of each top flange tab. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated (see p. 20, note k for welding information). Weld on applications produce the maximum allowable down load listed. For uplift loads refer to technical bulletin T-C-WELDUPLFT at strongtie.com.
- Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.
- For modified hangers, fastener quantity may increase from the tables depending on joist size, skew and slope.
- Bevel cut the carried member for skewed applications.

Options:

- See modification tables for allowed options and associated load reductions on p. 131

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

LBAZ and BA are acceptable for weld-on applications. See Installation Information.

						(16) 0.162 x 3 1/2	(8) 0.148 x 1 1/2	1,275	4,715	4,320	4,720	4,005	
HB	10			11 to 16	3 1/2	(22) 0.162 x 3 1/2	(10) 0.162 x 3 1/2	2,075	5,818	5,640	5,395	3,820	

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.

3. Where noted for single-ply joist hangers, use (6) 0.148" x 1 1/2" nails.

4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Nailer Table

Model No.	Nailer	Fasteners (in.)		DF/SP Allowable Loads		SPF/HF Allowable Loads

		(14) 0.162 x 3 1/2	(8) 0.148 x 1 1/2	1,170	3,230	1,005	2,650
	Steel	(6) PDPAT-62KP	(2) 0.148 x 1 1/2	—	3,695	—	3,695
HB	(2) 2x	(18) 0.148 x 3	(10) 0.148 x 1 1/2	585	3,810	505	3,000
	3x	(18) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	885	3,810	765	3,000
	4x	(22) 0.162 x 3 1/2	(10) 0.148 x 1 1/2	1,465	5,200	—	—

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed.

Reduce where other loads govern.

2. Attachment of nailer to supporting member is by the designer.

3. PDPAT allowable loads apply to steel header material with thickness between 1/4" and 3/4".

Minimum F_y = 36 ksi. Steel header by designer.

4. 0.157"-diameter x 5/8"-long powder-actuated fastener = PDPAT-62KP. A red (level 5) or purple (level 6) load may be required to achieve specified penetration.

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Joist, Beam and Purlin Top-Flange Hangers (cont.)

Modifications and Associated Load Reductions

Hanger	Condition	Seat						Top Flange	
		Sloped Down 45° Max.	Sloped Up 45° Max.	Skewed 45° Max.	Sloped Down and Skewed	Sloped Up and Skewed		Top Flange Sloped 35° Max.	Top Flange Bent Open or Closed 30° Max.
BA	Min. height →	6	6	6	9¼	14	9¼	14	9¼
	W < 2½"	0.82	0.66	0.95	0.54	0.82	0.64	0.64	(90 - a) / 90
	W ≥ 2½"	0.8	0.95	1	0.7	1	0.8	0.8	(90 - a) / 90
HB	Min. height →	8	8	8	11¼	14	11¼	14	11¼
	W < 2½"	0.84	0.7	1	0.47	0.84	0.62	0.69	(90 - a) / 90
	W ≥ 2½"	0.87	0.7	0.96	0.59	0.87	0.7	0.7	(90 - a) / 90

1. Reduction factors are not cumulative. Use the lowest factors that apply.

2. For straight-line interpolation, "a" is the specified angle.

3. The sloped top flange option is permitted for BA hangers with a minimum height of 11¼" when the load reduction factor is applied to the tabulated BA allowable loads for the minimum installation.

4. Allowable loads and reduction factors apply to backed and unbacked installations.

Reduction Factor Instructions

Allowable Download = Lower of (Seat or Top Flange) × (Table Load)

Allowable Uplift = 0.90 × (Table Load) for BA with W < 2½"

= 0.71 × (Table Load) for HB with W < 2½"

= 1.00 × (Table Load) for all others

Sloped down and skewed left with sloped top flange installation.
When ordering, specify low side flush, center flush or high side flush.

WP/HWP/HWPH

Purlin Top-Flange Hangers

The WP, HWP and HWPH series purlin hangers offer the greatest design flexibility and versatility.

The HWP and HWPH high-wind purlin hangers have enhanced uplift. They are ideal for high-wind applications.

Material: (Top flange/stirrup): WP — 7/12 gauge; HWP — 7/12 gauge; HWPH — 3/7 gauge

Finish: Simpson Strong-Tie gray paint; hot-dip galvanized available: specify HDG, contact Simpson Strong-Tie

Installation:

- Use all specified fasteners.
- H dimensions are sized to account for normal joist shrinkage. W dimensions are for dressed timber widths.
- WP/HWP/HWPH hangers may be welded to steel headers with a minimum 1 1/2"-long fillet weld on each side of the top flange to the header. Weld sizes: WP = 3/16", HWP = 3/16", HWPH = 1/4" (see p. 20, note k for weld information). Weld-on applications achieve maximum allowable download. Uplift loads do not apply to this application. For uplift loads, refer to technical bulletin T-C-WELDUPLFT at strongtie.com.
- Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- If joist is shorter than hanger by more than 1/2", then use only 50% of the table loads.

Options:

- See Hanger Options General Notes on p. 101.
- Refer to technical bulletin T-C-SLOPEJST at strongtie.com for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes ($\leq 3/4:12$).
- Some model configurations may differ from those shown. Contact Simpson Strong-Tie for details. For special order WP hangers, see technical bulletin T-C-WP-WS at strongtie.com.
- WP models are available in Type A (bevel-cut) or Type B (square-cut) style. Contact Simpson Strong-Tie when ordering.
- HWP may have a sloped and/or skewed seat up to 45°. WP and HWPH may be sloped up to 45° and/or skewed up to 84°.
- Hangers with a skew greater than 15° may have all the joist nails on the outside angle.
- For skewed condition, top flange width can increase up to 18". Contact Simpson Strong-Tie for specific application.
- Specify the slope up or down in degrees from the horizontal plane and/or the skew right or left in degrees from the perpendicular vertical plane. Specify whether low side, high side or center of joist will be flush with the top of the header (see illustration).

Ridge Hanger (only available for WP)

- Top flange may be sloped to a maximum of 35° to accommodate a ridge (see illustration). Specify angle of the slope. Reduce allowable load using straight-line interpolation. See Open/Closed example. Specify H/L/C flush when ordering sloped top flange.

Saddle Hanger (WPD)

- WPD saddle hanger allowable loads are WP loads for each stirrup. Saddle hangers on stud walls do not achieve catalog loads.
- Recommended S dimension is 1/16" oversized for carrying members 2 1/2" wide and less or 1/8" oversized for greater than 2 1/2" wide.

Codes: See p. 13 for Code Reference Key Chart

	2 3/16 – 2 3/4	4	10
	3 1/4 – 3 3/16	3 1/4	10
	3 13/16 – 6 3/4	3 1/4	12
	6 13/16 – 7 1/2	3 1/4	14

Nailer Table

The table indicates the maximum allowable loads for WP, HWP and HWPH hangers used on wood nailers. Nailers are wood members attached to the top of a steel beam, concrete or masonry wall.

Model	Nailer	Fasteners (in.)		Uplift ¹ (160)	Allowable Down Loads		
		Header	Joist		DF/SP	SPF/HF	LSL
WP	2x	(4) 0.148 x 1 1/2	(2) 0.148 x 1 1/2	—	2,465	1,985	3,150
	(2) 2x	(4) 0.148 x 2 1/2	(2) 0.148 x 1 1/2	—	2,985	2,230	—
	3x or 4x	(4) 0.162 x 2 1/2	(2) 0.148 x 1 1/2	—	2,985	2,230	3,375
HWP	(2) 2x	(9) 0.148 x 3	(10) 0.148 x 1 1/2	710	4,415	3,860	4,415
	3x	(9) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	970	4,415	3,860	—
	4x	(9) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	1,535	4,920	3,860	4,920
HWPH	(2) 2x	(12) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	710	5,910	4,820	5,910
	3x	(12) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	970	5,970	5,125	—
	4x	(12) 0.162 x 3 1/2	(10) 0.148 x 1 1/2	1,550	5,970	5,125	5,970

Installation on Wood Nailer

- Attachment of nailer to supporting member is the responsibility of the designer.
- Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Various Header Applications

Model	Joist (in.)		Fasteners (in.)			Allowable Loads Header Type							Code Ref.
	Width	Height	Top	Face	Joist	Uplift (160)	LVL	PSL	LSL	DF/SP	SPF/HF	I-Joist	
WP	1 1/2 to 7 1/2	5 3/8 to 30	(4) 0.148 x 1 1/2	—	(2) 0.148 x 1 1/2	—	2,935	3,150	—	2,465	1,985	2,030	—
	2 1/2 to 7 1/2	5 3/8 to 30	(4) 0.148 x 2 1/2	—	(2) 0.148 x 1 1/2	—	2,935	3,150	3,150	2,985	2,230	—	IBC®, FL, LA
	3 1/2 to 7 1/2	5 3/8 to 30	(4) 0.162 x 2 1/2	—	(2) 0.148 x 1 1/2	—	3,095	3,605	3,605	2,985	2,230	—	
HWP	1 1/2 to 7	6 to 15 3/8	(3) 0.162 x 3 1/2	(6) 0.162 x 3 1/2	(10) 0.148 x 1 1/2	1,535	3,995	4,500	4,350	3,955	3,955	—	
	1 1/2 to 7	15 3/4 to 28	(3) 0.162 x 3 1/2	(6) 0.162 x 3 1/2	(12) 0.148 x 1 1/2	1,570	3,995	4,500	4,350	3,955	3,955	—	
HWPH	1 13/16 to 7 1/2	6 to 15 3/8	(4) 0.162 x 3 1/2	(8) 0.162 x 3 1/2	(10) 0.148 x 1 1/2	1,685	6,595	7,025	5,450	5,920	4,740	—	—
	1 13/16 to 7 1/2	15 3/4 to 32	(4) 0.162 x 3 1/2	(8) 0.162 x 3 1/2	(12) 0.148 x 1 1/2	2,075	6,595	7,025	5,450	5,920	4,740	—	

- Code values are based on DF/SP header species.
- Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

WP/HWP/HWPH

Purlin Top-Flange Hangers (cont.)

Modifications and Associated Load Reductions for WP/HWP/HWPH

Models	Seat						Top Flange			Top Flange and Seat				Joist Height
	Seat Sloped 45° Max.		Seat Skewed Type A	Seat Skewed Type B		Seat Sloped and Skewed Type A 1°–45°	Top Flange Sloped 35° Max.	Top Flange Bent Open or Closed 30° Max.	Top Flange Offset	Top Flange Offset and Skewed Seat Type A, Bevel Cut 1°–45°		Top Flange Offset and Skewed Seat Type B, Plumb Cut 1°–84°		Joist Shorter Than Hanger
	Slope Up	Slope Down	1°–45°	1°–45°	46°–84°					Narrow	Wide	Narrow	Wide	
WP		1.0		1.0		1.0			0.5	0.5	0.25	0.3		By more than ½": 0.50 By ½" or less: 1.00
HWP	1.0	0.8	1.0	N/A		0.8	(90–a)/90	(90–a)/90	0.5	0.6	0.5	0.6	N/A	
HWPH				0.8	0.7								0.5	

1. For straight-line interpolation, "a" is the specified angle.

2. Reduction factors are not cumulative. Use the lowest factors that apply.

3. Narrow ≤ 3½", Wide > 3½".

4. HWP and HWPH options receive catalog uplift loads except: top flange offset 30% of the table load, skewed type A is 75% of the table load and HWPH only skewed type B is 50% of the table load.

5. Top flange bent closed is not available for HWP or HWPH.

Reduction Factor Instructions

Allowable Download = (lowest of Seat, Top Flange, or Joist Height) × (Table Load). See pp. 136–140 for table loads.

Allowable Uplift = as noted in table per height, see table above.

**Typical HWP Top View
Skewed Left Type A Hanger**

Typical WP sloped down, skewed right with type A hanger (joist end must be bevel cut).
When ordering, specify low side flush, center flush or high side flush.

HUTF/HUSTF

Heavy-Duty and Double-Shear Top-Flange Joist Hangers

See dimensions, material, loads on table pages.

HUSTF has the double-shear nailing advantage — distributing the joist load through two points on each nail for greater strength.

Finish: Galvanized.

Installation:

- Use all specified fasteners; see General Notes
- Not acceptable for nailer or welded applications; see WP, HWP, HWPH and BA hangers
- HUTF — The minimum header or ledger size that can be used with this hanger is 3½"
- HUSTF — With 3x carrying members, use 0.162" x 2½" nails into the header and 0.162" x 3½" nails into the joist

Options:

- See Hanger Options General Notes on p. 101.
- HUTF rough beam sizes are available by special order.
- HUSTF cannot be modified.

Sloped and/or Skewed Seat

- HUTF can be skewed to a maximum of 45° or sloped to a maximum of 45°. HUTF can be skewed and sloped down only, provided $W \geq 2\frac{3}{8}"$. No skew with slope up options available.
- For skews greater than 15°, uplift loads are 0.75 of the table loads. Hangers with a skew greater than 15° may have all the joist nailing on the outside angle.
- For sloped and skewed combinations, the allowable loads are 0.70 of the table loads.
- For sloped down only hangers, allowable load is 0.78 of the table load.

Concealed Flange

- HUTF is available with one A flange concealed at 0.85 of the catalog table load.
- HUTF is available with both flanges concealed provided the W dimension is 2⅝" or greater, at 0.85 of the table load. Specify HUCTF for both flanges concealed. No skew options available.

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

Nailer application is not acceptable. Fasteners cannot be installed.

Typical HUTF Installation

Double-Shear Nailing Top View

Some model configurations may differ from those shown. Production models have projected seats. Square-cut seats may be ordered. Contact Simpson Strong-Tie for details.

Typical HUTF Sloped Down Installation

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed.

For normal loading applications such as cantilever construction, refer to the Simpson Strong-Tie Hanger Selector web application or conservatively divide the uplift load by 1.6.

2. N54A fasteners are supplied with hangers.

3. Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.

4. HGLT information can be found on pp. 180–181.

5. Hangers with an “**” do not have an Installed Cost Index.

6. **Fasteners:** Nail dimensions in the table are listed diameter by length. See pp. 23–24 for fastener information.

Codes: See p. 13 for Code Reference Key Chart

Specify joist-to-beam connections by visiting app.strongtie.com/hs to access our Hanger Selector web application.

Top-Flange Hangers — Solid Sawn Lumber (SPF/HF)

These products are available with additional corrosion protection. For more information, see p. 16.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction, refer to Simpson Strong-Tie [Hanger Selector web application](#) or conservatively divide the uplift load by 1.6.

2. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Specify joist-to-beam connections by visiting app.strongtie.com/hs to access our Hanger Selector web application.

PF/PFB/PFDB

Post Frame Top-Flange Hangers

The PF series hangers have been designed to accommodate collated 0.148" x 1½" nails as well as 0.148" x 3" nails. The PFB and PFDB have dome-shaped joist nail holes that guide nails into the proper installation angle. The design also features a folded seat that raises the 2x joist very slightly above the seat radius to enable a tighter connection to the back of the hanger. For saddle hangers, PFDB and PFDSB are for solid sawn lumber carrying members, and PFDL is for LVL carrying members.

Features:

- Installation prongs make setting the hanger quick and easy
- Sizes are available for 2x8 joists

Material: PF — 18 gauge, PFB/PFDB — 20 gauge

Finish: Galvanized. Some products available in ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes.
- 0.148" x 3" purlin nails must be driven at an angle through the purlin into the header. Combine with top nails to achieve table loads.
- 0.148" x 1½" purlin nails must be driven at an angle into the purlin but do not penetrate into the header. Combine with back face fasteners and top nails to achieve table loads.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

HH

Header Hanger

For fast, accurate installation of door and window headers and other cross members. HH header hangers can speed up the job, strengthen the frame, and eliminate the need for trimmers.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- Attachment to 2x studs will result in two round holes not being filled in the studs and load reductions as noted in table

Codes: See p. 13 for Code Reference Key Chart

Typical HH Installation

Model No.	Dimensions (in.)		Min. Post Size	Fasteners (in.)		DF/SP Allowable Loads						Code Ref.
						F ₁			F ₂	F ₃	F ₄	
	W	H		Stud	Header	(100)	(115)	(125)	(160)			
HH4	3 1/2	2 13/16	2x	(7) 0.148 x 1 1/2	(4) 0.148 x 1 1/2	850	965	1,035	—	540	625	IBC®, FL, LA
			Double 2x	(7) 0.162 x 2 1/2	(4) 0.162 x 2 1/2	1,005	1,140	1,230	—	720	965	
			3x	(9) 0.162 x 3 1/2	(4) 0.162 x 3 1/2	1,295	1,470	1,585	675	720	965	
HH6	5 1/2	5 1/8	2x	(10) 0.148 x 1 1/2	(6) 0.148 x 1 1/2	1,215	1,375	1,480	—	1,085	970	
			Double 2x	(10) 0.162 x 2 1/2	(6) 0.162 x 2 1/2	1,440	1,630	1,760	—	1,045	1,605	
			3x	(12) 0.162 x 3 1/2	(6) 0.162 x 3 1/2	1,725	1,955	2,110	980	1,045	1,605	

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. For 3x posts, 0.162" x 2 1/2" nails may be substituted with no reduction in load.
3. For SPF/HF lumber, use 0.86 x DF/SP allowable loads.
4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

HH Load Directions

RR

Ridge Rafter Connector

An interlock provides alignment control and correct nailing locations. For a rafter-to-face connector, flatten the top flange into the face plane. The RR may be used with rafters sloped up to 30°.

Material: 18 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes

Codes: See p. 13 for Code Reference Key Chart

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Model No.	Min. Rafter Size	Fasteners (in.)		Uplift (160)	DF/SP Allowable Loads ¹		Code Ref.
		Header	Rafter		Floor (100)	Roof (125)	
RR	2x6	(4) 0.148 x 1 1/2	(4) 0.148 x 1 1/2	130	330	330	IBC, FL, LA

1. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
2. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical RR Installation

HFN/F

Panelized Construction Hangers

The HF24N, HF26N, HF34N and HF36N hangers are designed for panels or components using jigs or similar devices for precision fabrication. Grip-groove feature provides positive lock into the 2x or 3x member without nailing. F series panel hangers are engineered components for panelized construction only.

Material: 18 gauge

Finish: Galvanized. Some products available in ZMAX® coating.

Standard Installation:

- Use all specified fasteners; see General Notes.
- On the F-series hanger, the diamond hole nail is non-structural and does not contribute to the load.
- For additional information on retrofit options see flier F-C-RUZNRUZ at strongtie.com.

Panelized Installation:

- Installing two nails through sheathing in middle of hanger achieves full load. See illustrations for fastener location requirements. See technical bulletin T-C-HFHANGER at strongtie.com for alternate nailing and allowable load adjustments.

Codes: See p. 13 for Code Reference Key Chart

Typical HF24N Installation
(HF34N similar)

HF26N
(HF36N similar)
Dimples hold joist securely in place.

Panelized Installation Nailing Zone

Double HF26N Nailer
Installation on Hybrid Truss

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Joist Size	Dimensions (in.)			Header Fasteners (in.)	Allowable Roof Loads (115/125)	Code Ref.
		W	H	TF			
HF24N	2x4	1 9/16	3 3/8	1 1/4	(2) 0.148 x 2 1/8	580	IBC®, LA
HF26N	2x6	1 9/16	5 3/8	1 1/4	(2) 0.148 x 2 1/8	635	
HF34N	3x4	2 9/16	3 3/8	1 1/4	(2) 0.148 x 2 1/8	690

F46Z	4x6	3 9/16	5 3/8	1 7/8	(2) 0.148 x 3	675	

1. 0.148" x 3" nails can be used for specified 0.148" x 2 1/8" nails.
2. **Fasteners:** Nail dimensions are listed diameter by length.
See pp. 23–24 for fastener information.

HFN Panelized Installation
(plan view)

Typical Hybrid Panelized Roof System

IUS/MIU

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The IUS is a hybrid hanger that incorporates the advantages of the face-mount and top-mount hanger. Installation is fast with the Strong-Grip™ seat, easy-to-reach face nails and self-jigging locator tabs.

The MIU series hangers are designed for commercial and high-load I-joist applications without requiring web stiffeners. The MIU features Positive Angle Nailing (PAN), which minimizes splitting of the flanges while permitting time-saving nailing from a better angle.

Material: IUS — 18 gauge; MIU — 16 gauge

Finish: Galvanized

Uplift Loads:

- Models have optional triangle joist nail holes for additional uplift. Properly attached web stiffeners are required.
- MIU — add four additional 0.148" x 1½" joist nails for a total uplift load of 975 lb.
- IUS — add web stiffeners and two 0.148" x 1½" joist nails in the triangle holes for a total uplift of 365 lb.

Installation:

- Use all specified fasteners. Verify that the header can take the required fasteners specified in the table. **Do not overspread hanger.** Side flanges should be in contact with top chord of I-joist. See pp. 99–100 for more installation information.
- IUS — fasten hanger to header. Position I-joist into hanger and snap into place. No joist nailing required. Some IUS models have triangle and round header nail holes. To achieve max. download, fill both round and triangle holes.
- IUS — Locator tabs are not structural. They may be bent back to adjust for hanger placement.
- IUS — for rimboard applications see technical bulletin T-C-RIMBDHGR at strongtie.com.
- IUS — I-joists with web stiffeners or rectangular sections can be used with the installation of (2) 0.148" x 1½" nails into the optional triangle joist nails.
- IUS — web stiffeners are not required with I-joists when the top flange is laterally supported by the sides of the hanger unless required by I-joist manufacturer.

Options:

- These hangers cannot be modified. However, these models will normally accommodate a skew of up to 5°. For sloped joists up to ¼:12 there is no reduction; between ¼:12 and up to ½:12, tests show a 10% reduction in ultimate hanger strength. Local crushing of the bottom flange or excessive deflection may be limiting; check with joist manufacturer for specific limitations on bearing of this type.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

IUS
(some IUS models have triangle holes in header flanges for min./max. nailing)

The Strong-Grip™ seat secures I-joists in position without joist nails.

Avoid a Misinstallation

Do not make your own holes. Do not nail the bottom flange.

IUS Installation Sequence

Step 1
Attach the IUS to the header.

Step 2
Slide the I-joist downward into the IUS until it rests above the large teardrop.

Step 3
Firmly push or snap I-joist fully into the seat of the IUS.

MIU

MIU with Correct PAN Installation

HUS/HHUS/HGUS™

Double-Shear Face-Mount Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

See hanger tables on pp. 156–162

These hangers are designed for applications where higher loads are needed (also see HUC and HUCQ).

All hangers in this series have double-shear nailing. This innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation and the use of common nails for all connections. (Do not bend or remove tabs.)

Material: HHUS — 14 gauge; HGUS — 12 gauge;
HUS 2x and 1¾ sizes — 16 gauge; HUS — 14 gauge

Finish: Galvanized. Some products available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes.
- Do not use double-shear hangers with I-joists.
- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.
- See p. 24 for alternate fastener sizes and load adjustments.

Options:

- HUS cannot be modified
- Other sizes available; contact Simpson Strong-Tie for details

HHUS — Sloped and/or Skewed Seat

- HHUS hangers can be skewed to a maximum of 45° and/or sloped to a maximum of 45°
- For skew only, maximum allowable download is 0.85 of the table load
- For sloped only or sloped and skewed hangers, the maximum allowable download is 0.65 of the table load
- Uplift loads for sloped/skewed conditions are 0.72 of the table load, not to exceed 2,475 lb.
- The joist must be bevel-cut to allow for double shear nailing

HGUS — Skewed Seat

- HGUS hangers can be skewed only to a maximum of 45°. Allowable loads are:

HGUS Seat Width	Carried Member End Condition			
	Square Cut		Bevel Cut	
	Uplift	Download	Uplift	Download
W < 2"	0.46	0.62	0.46	0.72
2" < W < 6"	0.41	0.46	0.41	0.85
6" < W < 6.75"		0.40		
6.75" < W < 7.25"	Not allowed	Not allowed		

Codes: See p. 13 for Code Reference Key Chart

U/HU/HUC/HUCQ

Face-Mount Hangers

See hanger tables on pp. 156–162.

U — The standard U hanger provides flexibility of joist to header installation. Versatile fastener selection with tested allowable loads.

HU/HUC — Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails.

HUCQ — Features concealed flanges so it can be installed close to the end of the supporting beam or on a post. They install with Strong-Drive® SDS Heavy-Duty Connector screws (supplied with the hanger) for high capacity and ease of installation.

Feature:

- HUCQ only — Fire-resistant F (flame) and T (temperature) rated in Intertek Design No. SST/WPCF 120-01.

Material: U — 16 gauge; HU/HUC/HUCQ — 14 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- HU/HUC — Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- HUCQ — When using structural composite lumber columns, the capacities shown in the tables are for fasteners applied to the wide face of the column.
- Web stiffeners are required for all I-joists used with these hangers.
- For installation to masonry or concrete, see pp. 253–255.
- HU/HUC/HUCQ hangers can be welded to a steel member.
For HU/HUC allowable loads, refer to technical bulletin T-C-HU/HUC-W at strongtie.com. HUCQ allowable loads listed in hanger tables on pp. 156–162 apply when installed with minimum (6) 1" welds.

Options:

- Order HUC_X hanger. For both flanges concealed, order HUC.

Sloped, Skewed and Sloped/Skewed:

- For low-cost, code-approved 45° skewed hangers, see SUR/SUL on pp. 164–165.
- For field-adjustable hangers, see LSSR on pp. 166–167.
- See modification table for available options and associated load capacities for U and HU hangers.
- HUCQ cannot be modified.

High-Capacity Girder Hangers

The GU hangers are high-capacity girder hangers designed for situations where the header and joist are flush at top. This part can be used for retrofit on the framing members after they are temporarily placed in position. It uses Strong-Drive® SDS Heavy-Duty Connector screws to make installation fast and easy, with no predrilling required.

Feature:

- Fire-resistant F (flame) and T (temperature) rated in Intertek Design No. SST/WPCF 120-01.

Material:

See table

Finish: Galvanized, HHGU — Simpson Strong-Tie gray paint

Installation:

- Use all specified fasteners; see General Notes.
- Install with 1/4" x 2 1/2" Strong-Drive SDS Heavy-Duty Connector screws (SDS), which are provided with the GUs. (Note: lag screws will not achieve the same loads.)
- Alternatively, the 1/4" x 2 1/2" SDS face screws supplied with these hangers may be replaced with 1/4" x 3 1/2" SDS or 1/4" x 5" SDS screws for two-ply or three-ply LVL headers to transfer the hanger load to all plies. This alternate fastener option does not eliminate the need for uniform fastener requirements along the length of the multi-ply header.
- All multi-ply members must be fastened together to act as a single unit.
- Multiple-member headers may require additional fasteners at the hanger locations. The quantity and location of the additional fasteners must be determined by the designer.

Options:

- Hot-dip galvanized available. Order as "X" version; specify HDG.
- Other seat widths available. Order as "X" version; specify width.

Concealed Flange

- LGU, MGU, HGU and HHGU are available with one flange concealed. Specify flange to conceal.

- Allowable loads for one flange-concealed option:

LGU 1.00 of published load

MGU 0.88 of published load

HGU 0.75 of published load

HHGU 0.75 of published load

- On LGU with W 3/4" or less, MGU with W 4" or less and HGU with W 4 1/8" or less, flanges cannot be concealed.

Skewed

- LGU, MGU, HGU, LGUM and HGUM hangers are available skewed up to 45°.
- Apply the following reduction factors to published loads:

Reduction Factors for Skewed LGU, MGU and HGU

Model	Seat Width	Carried Member End Condition			
		Square Cut		Bevel Cut	
		Uplift	Download	Uplift	Download
LGU	All widths	0.60	0.90	0.60	0.90
MGU and HGU	W < 6.75"	0.65	0.75	0.65	0.80
	W ≥ 6.75"	Not allowed	Not allowed	0.55	

- Concealed flanges are not available with skewed models.

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Header height shall be greater than or equal to flange height (h_a).

3. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive® SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

CBH™/ACBH™

Concealed Beam Hangers (End Grain)

Computer modeling and CNC manufacturing enable glulam beams to be delivered to the jobsite in precise lengths and with preinstalled concealed hangers. The CBH and ACBH are concealed end-grain beam hangers specifically designed for such applications. The connector backplates slide together for fast assembly on-site and the concealed design provides a wood-only aesthetic and fire protection. Both the CBH and ACBH have been tested for inter-story drift and have achieved one-hour and two-hour fire resistance ratings according to ASTM E119.

Material: CBH — 3 gauge;
ACBH — ASTM B221 6061-T6 Aluminum

Finish: CBH — Electrogalvanized or HDG;
ACBH — None

Installation:

- Use all specified fasteners; see General Notes
- ACBH is recommended for dry-service applications only

Codes: ICC-ES ESR-2552

Seismic Deformation Compatibility Testing:

Recommended for use at beam-to-beam connections in any Seismic Design Category. For recommendations at beam-to-column connections, see engineering letters L-C-ACBHDRIFT and L-C-CBHDRIFT at strongtie.com.

For additional information, including installation instructions, lateral loads and ordering information, see strongtie.com.

- Table loads for ACBH are for $e_{\text{side}} > 1\frac{1}{16}"$. For $1\frac{1}{16}" < e_{\text{side}} < 1\frac{3}{16}"$, multiply allowable load by 0.93.
- Table loads for CBH are for $e_{\text{side}} \geq 1\frac{3}{16}"$. For $\frac{9}{16}" < e_{\text{side}} < 1\frac{3}{16}"$, refer to engineering letter L-C-CBH4XSKEW at strongtie.com. For the CBH installed centered on a $3\frac{1}{2}"$ wide member, $e_{\text{side}} = \frac{9}{16}"$.
- For installation of Simpson Strong-Tie Strong-Drive® SDWC15600 screws into the top of the beam for uplift: install screw at a 45° angle $2"$ from the end of the beam. Minimum spacing requirements for SDWC15600 screws are $\frac{1}{2}"$ edge distance and $1"$ screw spacing when using multiple screws. Uplift capacity is 555 lbf for DF/SP and 485 lbf for SPF/HF per screw. Use multiple screws for additional uplift.
- Allowables load for double connections are equivalent to the allowable load of one connection multiplied by 2.
- CBH may be installed on supporting vertical columns using SDS $\frac{1}{4}" \times 3"$ screws with reduced download capacities. Beam to beam allowable download capacities apply.
- Fasteners:** SDCF22434 and SDCF22614 = $0.315"$ O.D. by $4\frac{3}{4}"$ long and $6\frac{1}{4}"$ long Strong-Drive SDCF Timber-CF™ screw, respectively. SDS25600 and SDS25300 are $\frac{1}{4}" \times 6"$ long and $3"$ long Strong-Drive SDS Heavy-Duty Connector screw, respectively. See pp. 23–24 for fastener information.

- Side edge distances for supporting vertical columns must meet or exceed the e_{side} table values for the supported beam.
CBH: for conditions where fire resistance need not be considered and ⅞" < e_{side} < 1⅞", refer to engineering letter L-C-CBH4XSKEW at strongtie.com.
ACBH: for 1⅞" ≤ e_{side} < 1⅞", see footnotes of the Allowable Download table on p. 151 for allowable load reduction.
- Side edge distances for supporting vertical columns must meet or exceed the e_{side} table values for the supported beam.
- Minimum carried beam sizes and edge distances for one-hour and two-hour fire resistance are based on ASTM E119 fire testing. Test specimens included 3M Expanrol E-FIS intumescent fire seal at the beam-to-column interface. Substitutions for the 3M Expanrol are allowable provided they meet or exceed the 3M Expanrol's specifications for flame spread, smoke developed index, intumescent activation temperatures (expansion rate) and service temperatures.
- Full coverage for the top of beam is for conditions where the top of the beam is not directly exposed to fire (i.e., roof or floor members attached to the top of the supported beam and providing complete continuous cover to the top of the carried beam). For conditions with the top of the carried beam being exposed to fire, increase the minimum top edge distance to e_{side} for the installed condition.
- For one-hour and two-hour fire resistance, the gap between the end of the carried member and the face of the carrying member shall not exceed ¼".

HSKP™

Heavy Seated Knife Plate

The new HSKP heavy seated knife plate connector preserves the look of mass timber beams while meeting high-demand loads. Offering the highest load ratings yet in our line of concealed beam hangers, the HSKP is tested for inter-story drift and is ICC-ES code listed. The HSKP installs in the factory with Strong-Drive® SDCF Timber-CF structural screws, saving valuable time on the jobsite. It offers generous fit-up tolerance for easy beam placement. For additional information, see *Connectors and Fasteners for Mass Timber Construction* catalog, C-C-MASSTIMBER at strongtie.com.

Features:

- High capacity
- Code listed in ICC-ES ESR-2552
- ASTM E119 1- and 2-hour fire tests pending; contact Simpson Strong-Tie
- Factory installation of connector reduces onsite labor
- Inclined screw hole feature reduces the overall screw count compared to horizontal screws
- Seated connector design allows for faster field installation and better crane cycle-time
- Options for wood-to-wood and wood-to-steel concealed connection
- Recommended for use at beam-to-beam or beam-to-column connections in any Seismic Design Category; see engineering letter L-C-HSKPDRIFT at strongtie.com for more information

Material: Back and knife plate — 3 gauge; bearing plate — ½"; HSKP5.75x19.5 and HSKP5.75x19.5-W knife plate — ⅜"

Finish: HSKP/HSKP-W — Simpson Strong-Tie gray paint, HSKP available in HDG and powder coat; SDCF screw — yellow zinc
CJTPL steel dowel — mechanically galvanized

Installation:

- Use all specified fasteners; see General Notes.
- For additional installation information and routing details, visit strongtie.com/HSKP.
- Prior to connection of the carried member to the HSKP hanger, supported member shall be prerouted to allow for the concealed installation of the HSKP and predrilled for the installation of the optional steel dowel.
- Designer shall determine the desired beam-end rout depth and bottom-of-beam rout depth for the desired concealed installation and potential fire considerations.
- For fully concealed installations requiring a bottom filler block, the connection is to be determined by the building designer.

Note: When installing SDCF screws for the HSKP connection, do not exceed recommended seating torque values (reference engineering letter L-C-MTINSTALL at strongtie.com).

Environment: Dry-service applications only

Codes: See p. 13 for Code Reference Key Chart

1. Uplift and F₂ loads have been increased for wind or seismic with no further increase allowed; reduce where other loads govern.
2. For HSKP installations on opposite faces (back-to-back) of the same supporting member, the minimum depth of the supporting member is 12 1/4" when installing the SDCF27614 (6 1/4" long) bottom horizontal screws and 8 3/4" when installing the SDCF27400 (4" long) bottom horizontal screws.
3. **Fasteners:** SDCF27400 and SDCF27614 = 0.390" O.D. by 4" long and 6 1/4" long Strong-Drive® SDCF TIMBER-CF screw, respectively. SDCF22858 = 0.315" O.D. by 8 3/8" long Strong-Drive SDCF TIMBER-CF screw.

**Strong-Drive® SDCF TIMBER-CF Screw**

SDCF22858 = 0.315" O.D. by 8 3/8" (220 mm) long
 SDCF27614 = 0.390" O.D. by 6 1/4" (160 mm) long
 SDCF27400 = 0.390" O.D. by 4" (100 mm) long

Face-Mount Hangers — I-Joists, Glulam and SCL

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

Codes: See p. 13 for Code Reference Key Chart.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Uplift loads are based on DF/SP. For SPF/HF, use 0.86 x DF/SP Uplift Load for products requiring nails and 0.72 x DF/SP Uplift Load for products requiring screws.
- For minimum nailing quantity and load values, fill all round holes; for maximum nailing quantity and load values, fill all round and triangular holes.
- Hangers sorted in order of recommended selection for best overall performance and installation value.
- Web stiffeners are required where noted in the table, or when the joist top flange isn't supported laterally by the hanger, or when it supports double I-joists with flanges less than 1⅞" thick.
- Allowable downloads are based on a joist-bearing capacity of 750 psi.
- Fasteners:** Nail dimensions are diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive® SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Visit app.strongtie.com/hs to access our Hanger Selector web application.

THAI

Adjustable Hanger

Designed for I-joists, the THAI has extra long straps and can be field-formed to give height adjustability and top-flange hanger convenience. Positive-angle nailing helps eliminate splitting of the I-joist's bottom flange.

Material: THAI-2 — 14 gauge; all others — 18 gauge

Finish: Galvanized

Installation:

- Factory-order the THAI-2 for hanger width needed. See table for allowable widths.
- Use all specified fasteners. Verify that the header can take the fasteners specified in the table.
- Web stiffeners are required for all I-joists used with these hangers.
- When a total of 20 face nails are used in THAI straps, or 30 face nails are used in THAI-2 straps, the maximum load-carrying capacity is achieved.
- Reduce load given by allowable nail shear capacity for each nail less than maximum.
- A minimum nailing configuration is shown for top nailing installations. The strap must be field-formed over the top of the header by a minimum of 2½".
- Uplift — Lowest face nails must be filled to achieve uplift loads.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

Typical THAI Installation with Minimum Nailing Configuration

Joist Dimensions (in.)		Model No.	Hanger Dimensions (in.)			Code Ref.
Width	Depth		W ₁	H	C	
1½	9¼ – 14	THAI222	1⅞	22⅞	9⅞	IBC®, FL, LA
1¾	9¼ – 14	THAI1.81/22	1⅞	22¾	9¼	
2	9¼ – 14	THAI2.06/22	2⅞	22⅞	9⅞	
2⅞	9¼ – 14	THAI2.1/22	2⅞	22⅞	9⅞	
2¼ to 2⅞	9¼ – 14	THAI3522	2⅞	22½	9	
2½	9¼ – 14	THAI322	2⅞	22⅞	8⅞	
3½	9¼ – 14	THAI422	3⅞	21⅞	8⅞	—
3 to 5¼	9¼ – 14	THAI-2	3⅞ to 5⅞	21 ⅞	8⅞	

1. The W dimension should be ordered at ⅞" to ⅝" greater than the joist width.

Allowable Loads for Various Headers

Nailing Options	Fasteners (in.)			Allowable Loads									
	Top	Face	Joist	Uplift (160)	LVL Header			DF/SP Header			SPF/HF Header		
					Floor (100)	Snow (115)	Roof (125)	Floor (100)	Snow (115)	Roof (125)	Floor (100)	Snow (115)	Roof (125)
THAI minimum	(4) 0.148 x 1 ½	(2) 0.148 x 1 ½	(2) 0.148 x 1 ½	—	1,350	1,350	1,350	1,325	1,325	1,325	1,070	1,070	1,070
	(4) 0.148 x 3	(2) 0.148 x 3	(2) 0.148 x 1 ½	—	1,465	1,465	1,465	1,735	1,735	1,735	1,680	1,680	1,680
THAI maximum	—	(20) 0.148 x 3	(2) 0.148 x 1 ½	185	2,080	2,080	2,080	2,080	2,080	2,080	1,790	1,790	1,790
THAI-2 minimum	(4) 0.148 x 3	(2) 0.148 x 3	(2) 0.148 x 1 ½	—	1,445	1,445	1,445	2,095	2,095	2,095	2,095	2,095	2,095
THAI-2 maximum	—	(30) 0.148 x 3	(2) 0.148 x 1 ½	185	3,390	3,900	4,135	3,390	3,900	4,135	2,940	3,310	3,310

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.

3. The minimum header depth to achieve the maximum nail configuration is 16".

4. For the THAI3522 supporting a 2¼" joist, the download shall be the lesser of the table load or 1,400 lb.

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

THAI Allowable Loads for Top-Flange Min. Nailing Installation on Nailers

Model	Nailer	Top (in.)	Face (in.)	Joist (in.)	Uplift (160)	Allowable Loads (100/115/125)	
						DF/SP	SPF/HF
THAI Series	2x	(4) 0.148 x 1½	(2) 0.148 x 1½	(2) 0.148 x 1½	—	1,245	1,070
	Min. 2–2x	(4) 0.148 x 3	(2) 0.148 x 3	(2) 0.148 x 1½	—	1,735	1,680
THAI-2	Min. 2–2x	(4) 0.148 x 3	(2) 0.148 x 3	(2) 0.148 x 1½	—	2,095	2,095

1. Loads for 2x nailers are applicable to single 4x2 top chord carrying members provided the hanger is located at a top chord panel point and there is no splice at that panel point location.

2. Attachment of nailer to supporting member is the responsibility of the designer.

3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

SUR/SUL/HSUR/HSUL

Skewed 45° Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The SUR/L1.81, 2.06, 2.1, 2.37, 2.56 and HSUR/L series are 45° skewed hangers designed specifically to ease the installation of single and double I-joists. In addition to Positive Angle Nailing these hangers encapsulate the top flange of the I-joist, so no web stiffeners are required for standard installation.

The full range of 45° skewed hangers feature obround nail holes on the acute side, allowing nails to be easily installed parallel to the joist. Installation is further simplified with no required bevel cuts.

Material: See table on p. 165.

Finish: Galvanized. Some products available in ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes.
- Illustrations show left and right skews SUR/L (SUR = skewed right; SUL = skewed left).
- The joist end may be square cut or bevel cut.
- Fill all round and obround nail holes with specified fasteners to achieve table loads. Where noted, triangle holes in the joist flange may be filled for additional uplift capacity (see footnote on p. 165).
- For I-joists with flanges less than 1 5/16", web stiffeners are required for all double joist hangers when using hangers that are 14 gauge and lighter.

Options:

- These hangers cannot be modified but will accommodate a 40° to 50° skewed joist.
- Available with the A₂ flange turned in on (2) 2x and 4x models only (see illustration). For example, specify HSURC410, HSULC410, SURC210-2 or SULC210-2.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Triangular nail holes may be filled with 0.148" x 1½" nails for additional uplift (requires web stiffeners).

• SUR/SUL 9" and 11", SUR/SUL 1.81/14, and all HSUR/HSUL models have additional holes that, when filled, can resist 795 lb. for DF/SP or 685 lb. for SPF/HF.

• SUR/SUL 14" models have (6) additional holes that, when filled, can resist 1,190 lb. for DF/SP and 1,025 lb. for SPF/HF.

3. When the supported member is an I-joist with flanges less than 1⅞" thick, the allowable uplift shall not exceed 190 lb. without web stiffeners.

4. Allowable downloads are based on a joist-bearing capacity of 750 psi.

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

LSSR™/LSU

Slopeable/Skewable Rafter Hanger

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The patent-pending LSSR slopeable/skewable rafter hanger is the next generation of field-adjustable rafter hangers. One of its key features is it can be installed after the rafter has been tacked into place. A versatile hanger, it is field adjustable for skews up to 45° and features an innovative hinged swivel seat which adjusts up to a 45° slope. New models are now available for single 2x truss members. See pp. 122–123 for more information.

Features:

- Makes it possible to install after the rafters are already in place
- Flange design allows for easy skew (left or right) adjustment, from 0° to 45°
- Swivel seat adjusts easily from 0° to 45° up or down, and attaches to both sides of I-joist

Material: See table on p. 167

Finish: ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes
- Limit on-center spacing of rafters and joists with LSSR210-2Z and LSSR410Z to 14" o.c., minimum; for the LSSR1.81Z, LSSR2.1Z, LSSR2.37Z and LSSR2.56Z, limit the on-center spacing to 11" o.c., minimum
- For a common rafter:
 - Slide hanger into position; Adjust seat and install seat nails
 - Make sure side stirrups are snug close to the joist; bend lines are plumb
 - Install a face nail on each side to hold in place
 - Install all round and obround holes on the header and joist
- For jack rafters:
 - Fold acute side forward
 - Slide hanger into position; adjust seat and install seat nails
 - Make sure hanger is snug close to the joist; bend line is plumb
 - Install obround nails on acute side, both header and joist
 - Make sure hanger is snug close to the joist and header; bend line is plumb
 - Install joist nails on obtuse side
 - Bend obtuse side flange back so that header flange is flush against header
 - Install header nails

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. For slope-only installations, the four triangle holes may be filled for an allowable roof download of 3,015 lb. for DF/SP and 2,595 lb. for SPF/HF for LSSR 16GA.
3. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
4. LSU3510-2, LSU4.12, LSU4.28, and LSU5.12 skew options must be factory-ordered.
5. Minimum 11" joist height for LSU3510-2, LSU4.12, LSU5.12; 9 1/2" for all others.
6. On the acute side of the skewed LSSR hanger, fill obround holes only.
7. **Fasteners:** Nail dimensions are listed diameter by length.
See pp. 23–24 for fastener information.

The LSU5.12 must be factory-skewed 0° to 45°. It may be field-skewed to 45°. (LSU4.12, LSU4.28 and LSU3510-2 similar)
Hanger shown skewed right.

HRC/HHRC™

Hip-Ridge Connectors

The HRC series are field slopeable connectors that attach hip roof beams to the end of a ridge beam. The HRC may be sloped downward a maximum of 45° (included with part). HHRC accommodates higher loads and uses Strong-Drive® SD Connector screws.

Material: HRC1.81 — 16 gauge; HHRC — 12 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners (included with HHRC); see General Notes.
- On end of ridge — use optional diamond holes on HRC1.81 to secure the HRC. Bend face flanges on HRC1.81 back flush with ridge, and complete nailing.
- HRC1.81 on face of ridge — adjust to correct height and install nails.
- Double bevel-cut hip members to achieve full bearing loads with HRC.
- The HRC may be sloped to 45° with no reduction in loads.

Codes: See p. 13 for Code Reference Key Chart

HRC Allowable Loads

Model No.	W (in.)	Member Size		Fasteners (in.)		DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.
		Hip	Ridge	Carrying Member	Each Hip	Uplift (160)	Floor (100)	Snow (115)	Roof (125)	Uplift (160)	Floor (100)	Snow (115)	Roof (125)	
HRC1.81	1 13/16	1 3/4"	2x or 1 3/4" wide	(16) 0.148 x 1 1/2	(2) 0.148 x 1 1/2	370	975	1,105	1,185	320	840	950	1,020	IBC®, FL, LA

1. Allowable loads shown are for each hip. Total load carried by the connector is double this number.
2. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
3. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

1. Allowable loads shown are for each hip. Total load carried by the connector is double this number.
2. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
3. See p. 126 for solid sawn sizes.
4. **Fasteners:** SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

Typical HRC Installation on the End of a Ridge

Optional HRC1.81 Installation

Typical HHRC Installation on the End of a Ridge

VPA

Variable-Pitch Connector

The VPA may be sloped in the field, offering a versatile solution for attaching rafters to the top plate. It will adjust to accommodate slopes between 3:12 and 12:12, making it a complement to the versatile LSSR. This connector eliminates the need for notched rafters, beveled top plates and toenailing.

Material: 18 gauge

Finish: Galvanized

Installation: Use all specified fasteners; see General Notes

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Loads may not be increased for duration of load.

3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

VPA Installation Sequence

Step 1

Install top nails and face PAN nails in "A" flange to outside wall top plate.

Step 2

Seat rafter with a hammer, adjusting "B" flange to the required pitch.

Step 3

Install "B" flange nails in the obround nail holes, locking the pitch.

Step 4

Bend tab with hammer and install 0.148" x 1½" nail into tab nail hole. Hammer nail in at an approximate 45° angle to limit splitting.

HCP

Hip Corner Plate

For complementary ridge connection, see pp. 166–167.

The HCP connects a rafter or joist to double top plates at a 45° angle.

Material: 18 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Attach HCP to double top plates.
- Birdsmouth not required for table uplift loads but may be required for download.
- Install rafter and complete nailing. Rafter may be sloped to 45°.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

HCP1.81
(HCP4Z similar)

These products are available with additional corrosion protection. For more information, see p. 16.

Member Size (in.)	Model No.	Fasteners		DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
		To Rafters	To Plates	(160)		(160)		
				Uplift	F ₁	Uplift	F ₁	
1¾	HCP1.81	(6) 0.148 x 1 ½	(6) 0.148 x 1 ½	590	255	510	220	IBC®, FL, LA
3½	HCP4Z	(8) 0.148 x 3	(8) 0.148 x 3	990	230	850	200	

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. The HCP can be installed on the inside and the outside of the wall with a flat bottom chord truss and achieve twice the load capacity.
3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical HCP Installation

ITS/MIT/HIT

Engineered Wood Product Top-Flange Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

Simpson Strong-Tie offers a dedicated range of top-flange I-joist hangers that meet the unique needs of I-joists while offering superior performance and ease of installation.

ITS

The innovative ITS sets the standard for engineered wood top-flange hangers. The ITS installs faster and uses fewer nails than any other EWP top-flange hanger. The Strong-Grip™ seat and Funnel Flange™ features allow standard joist installation without requiring joist nails, resulting in the lowest installed cost. The Strong-Grip seat firmly secures I-joists with flange thicknesses from 1 1/8" to 1 1/2".

MIT/HIT — Positive-Angle Nailing (PAN)

PAN is specifically designed for I-joists when used with the MIT or HIT. With PAN, the nail hole material is not removed, but is formed to channel and confine the path of the nail at approximately 45°. PAN minimizes splitting of the flanges while permitting time-saving nailing from a better angle. See top flange tables on pp. 185–194.

Refer to joist manufacturer's literature or appropriate Simpson Strong-Tie Connector Selection Guide for actual joist sizes.

Material: ITS — 18 gauge; MIT, HIT — 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners. Verify that the header can take the required fasteners specified in the table. **Do not overspread hanger during installation. Side flanges should be in contact of top chord of I-joist.** See pp. 99–100 for more installation information.
- ITS — no joist nailing required for standard I-joist installation without web stiffeners. When supporting I-joists with web stiffeners or rectangular SCL member (2) 0.148" x 1 1/2" nails must be installed into optional triangle joist nail holes for standard installation values.
- ITS — optional triangle nail holes may be used for additional load. See allowable load tables.
- MIT — optional triangle nail holes may be used for increased uplift capacity. See Optional Nailing For Increased Uplift table.
- HIT — closed PAN nail holes may be used for increased uplift capacity. See Optional Nailing For Increased Uplift table.
- For sloped joists up to 1/4:12 there is no reduction, between 1/4:12 and up to 1/2:12, tests show a 10% reduction in ultimate hanger strength. Local crushing of the bottom flange or excessive deflection may be limiting; check with joist manufacturer for specific limitations on bearing of this type.

Allowable Loads:

- The ITS, MIT and HIT hangers have locations for optional nails if additional uplift is needed. Optional uplift nailing requires the addition of properly-secured web stiffeners. See the load tables for minimum required fasteners and allowable uplift loads.
- For attaching to multi-ply headers, refer to technical bulletin T-C-MPLYHEADR at strongtie.com.

Options:

- Because these hangers are fully die-formed, they cannot be modified. However these models will normally accommodate a skew of up to 5°.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

ITS/MIT/HIT

Engineered Wood Product Top-Flange Hangers (cont.)

ITS Installation Sequence

Step 1
Attach the ITS
to the header.

Step 2
Slide the I-joist downward into the ITS
until it rests above the Strong-Grip™ seat.

Step 3
Firmly push or snap I-joist
fully into the seat of the ITS.

Positive-Angle
Nailing

Correct Nailing
Approx. 45° angle

1. Loads may not be increased for duration of load.
2. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
3. Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.
4. ITS uplift loads are valid for all lumber species and need not be reduced for duration of load.
5. LVL headers are assumed to be made primarily from Douglas fir or southern pine. For LVL made from spruce-pine-fir or similar less-dense veneers, use the values found in the SPF/HF column.
6. DF I-joists headers include flanges made from solid sawn Douglas fir, LVL made primarily of DF/SP, or LSL. For header flanges with thicknesses from 1 1/8" to 1 1/2", use 0.85 of the I-joist header load. For header flanges with thicknesses from 1 1/4" to 1 1/2", use 0.75 of the I-joist header load.
7. SCL (structural composite lumber) is LVL, LSL, and Parallam® PSL.
8. Web stiffeners required for the ITS Alternate Installation when installing optional joist nails for additional uplift load.
9. Code values are based on DF/SP header species.
10. I-joists with flanges less than 1 1/8" thick used in combination with hangers thinner than 14 gauge may deflect an additional 1/2" beyond the standard 1/8" limit.
11. For 2 1/4"-wide joists, see tables on p. 186 for allowable loads.

Optional Nailing for Increased Uplift

Model	Fasteners (in.)			Allowable Uplift Loads
	Top	Face	Joist	(160)
ITS	(4) 0.148 x 1 1/2	(4) 0.148 x 1 1/2	(4) 0.148 x 1 1/2	630
	(4) 0.148 x 3	(4) 0.148 x 3	(4) 0.148 x 1 1/2	630
	(4) 0.162 x 3 1/2	(4) 0.162 x 3 1/2	(4) 0.148 x 1 1/2	630
MIT	(4) 0.148 x 1 1/2	(4) 0.148 x 1 1/2	(4) 0.148 x 1 1/2	575
	(4) 0.162 x 3 1/2	(4) 0.162 x 3 1/2	(4) 0.148 x 1 1/2	575
HIT	(4) 0.162 x 3 1/2	(6) 0.162 x 3 1/2	(4) 0.148 x 1 1/2	575
	(4) 0.162 x 2 1/2	(6) 0.162 x 2 1/2	(4) 0.148 x 1 1/2	575
	(4) 0.162 x 3 1/2	(6) 0.162 x 3 1/2	(6) 0.148 x 1 1/2	850

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.
3. Web stiffeners are required on I-joist for additional nailing.

Visit app.strongtie.com/hs to access our Hanger Selector web application.

ITS/MIT/HIT

PDPAT

BA/HB

Top-Flange Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The BA hanger is a cost-effective hanger used for structural composite lumber and high-capacity I-joists. When used with I-joists, the positive angle nailing at the joist seat allows the hanger to be used without web stiffeners.

The HB hanger is also available with higher capacity for structural composite lumber and heavier I-joist applications.

See top flange tables on pp. 185–194.

Material: See tables on pp. 185–194.

- For modified hangers, gauge may increase from that specified for non-modified hangers. Hanger configurations, height and fastener quantity may increase from the tables depending on joist size, skew and slope.

Finish: BA and HB — Galvanized; BA and HB may be ordered hot-dip galvanized; specify HDG

Installation:

- Use all specified fasteners; see General Notes and nailer table.
- BA and HB may be used for weld-on applications. The minimum size weld is a 2"-long fillet weld to each side of each top flange; weld size to match hanger material thickness. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated, see p. 20, note k for weld information. Weld on applications produce the maximum allowable down load listed. For additional load information, refer to technical bulletin T-C-WELDUPLFT at strongtie.com.
- HB hanger requires the use of web stiffeners. BA min. nailing does not require web stiffeners. BA max. nailing requires the use of web stiffeners.
- Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.
- Refer to technical bulletin T-C-SLOPEJST at strongtie.com for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes ($\leq \frac{1}{4}:12$).
- Bevel cut the carried member for skewed applications.

Options:

- Other widths are available; specify W dimension (the minimum W dimension is 1 $\frac{1}{2}$ ").
- The coating on special BA hangers will depend on the manufacturing process used. Check with your Simpson Strong-Tie representative for details. Hot-dip galvanized available: specify HDG.
- For modified hangers, fastener quantity may increase from the tables depending on joist size, skew and slope. All modified hangers are 12 gauge.
- The BA and HB hangers may be modified for slopes and/or skews up to 45°. The top flanges may be sloped up to 35° and may be open or closed up to 30°. See associated load reduction on p. 176.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

BA Supporting Double LVL

Typical Double BA Hanger Installation.
BA Supporting Double I-Joist.

BA and HB are acceptable for weld-on applications. See Installation Information. (HB shown)

	2⅝–3½		(6) 0.162 x 3½	(16) 0.162 x 3½	(10) 0.162 x 2½	1,560	5,815	5,640	6,395	5,650	3,820	—	—	
	3⅝ to 7½		(6) 0.162 x 3½	(16) 0.162 x 3½	(10) 0.162 x 3½	2,075	5,815	5,640	6,395	5,395	3,820	—	—	

- This table assumes joists with F_c ⊥ = 750 psi. For other joists, check that bearing and joist nails are adequate.
- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.
- Loads may not be increased for duration of load.
- SCL (structural composite lumber) is LVL (laminated veneer lumber), LSL (laminated strand lumber), and Parallam® PSL.
- LVL headers are assumed to be made primarily from Douglas fir or southern pine. For LVL made from spruce-pine-fir or similar less-dense veneers, use the values found in the SPF/HF column.
- DF I-joists headers include flanges made from solid sawn Douglas fir, LVL made primarily of DF/SP, or LSL. For I-joist header flanges with thicknesses from 1 5/8" to 1 3/4", use 0.85 of the I-joist header load. For I-joist header flanges with thicknesses from 1 1/2" to 1 1/4", use 0.75 of the I-joist header load.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

	W < 2½"	0.82	0.66	0.95	0.54	0.82	0.64	0.64	(90 – a) / 90	(90 – a) / 90
	W ≥ 2½"	0.8	0.95	1	0.7	1	0.8	0.8	(90 – a) / 90	(90 – a) / 90
HB	Min. height →	8	8	8	11¼	14	11¼	14	14	11¼
	W < 2½"	0.84	0.7	1	0.47	0.84	0.62	0.69	(90 – a) / 90	(90 – a) / 90
	W ≥ 2½"	0.87	0.7	0.96	0.59	0.87	0.7	0.7	(90 – a) / 90	(90 – a) / 90

1. Reduction factors are not cumulative. Use the lowest factors that apply.

2. Web stiffeners are required for sloped or skewed conditions.

3. For straight-line interpolation, "a" is the specified angle.

4. The sloped top flange option is permitted for BA hangers with a minimum height of 11¼" when the load reduction factor is applied to the tabulated BA allowable loads for the minimum installation.

Visit app.strongtie.com/hs to access our Hanger Selector web application.

Reduction Factor Instructions

Allowable Download = Lower of (Seat or Top Flange) × (Table Load)

Allowable Uplift = 0.90 × (Table Load) for BA with W < 2½"

= 0.71 × (Table Load) for HB with W < 2½"

= 1.00 × (Table Load) for all others

Sloped down and skewed left with sloped top flange Installation.
When ordering, specify low side flush, center flush or high side flush.

WP/HWP/HWPH

High-Capacity Top-Flange Hangers

The WP, HWP and HWPH series are designed to support joists on wood purlins or beams.

The HWP and HWPH high-wind purlin hangers have enhanced uplift and are ideal for high-wind applications.

Material: (Top flange/stirrup): WP — 7/12 gauge; HWP — 7/12 gauge; HWPH — 3/7 gauge

Finish: Simpson Strong-Tie gray paint; HDG available

Installation:

- Use all specified fasteners.
- The WP, HWP and HWPH may be used for weld-on applications. The minimum size weld is a 1 1/2" long fillet weld to each side of the top flange; weld size to match hanger material thickness. See p. 20, note k for weld information. Weld-on applications have the maximum allowable capacity listed. For WP, uplift loads do not apply to this application. For additional load information, refer to technical bulletin T-C-WELDUPLFT at strongtie.com.
- Non-modified hangers can support joists sloped up to 1/4:12 using table loads. For joists sloping between 1/4:12 and 3/4:12 use 85% of the table loads. See technical bulletin T-C-SLOPEJST at strongtie.com.
- Web stiffeners are required for these hangers.
- If joist is shorter than hanger by more than 1/2" use only 50% of the table loads.
- For attaching to multi-ply headers, refer to technical bulletin T-C-MPLYHEADR at strongtie.com.

Options:

- HWP and HWPH may be sloped up to 45° and/or may have a sloped and/or skewed seat up to 45°. WP skewed up to 84°. See p. 179 for reduction associated with modifications.
- The top flange of the WP, HWP and HWPH may be offset and/or sloped down up to 35°. The top flange may also be opened/closed up to 30°. See p. 179 for reduction associated with modifications.
- All models are available in Type A (joist bevel cut up to 45°). See p. 179. WP is also available in Type B style (square-cut joist). Contact Simpson Strong-Tie when ordering.
- Hangers with a skew greater than 15° may have all the joist nails on the outside angle.
- Specify the slope up or down in degrees from the horizontal plane and/or the skew right or left in degrees from the perpendicular vertical plane.
- When combining skews and slopes specify whether low side, high side, or center of joist will be flush with the top of the header (see illustration on p. 179).

Ridge Hanger (WP only)

- Top flange may be sloped to a maximum of 35° to accommodate a ridge (see illustration). Specify angle of the slope. Reduce allowable load using straight-line interpolation. See open/closed example.

Saddle Hanger (WPD)

- WPD saddle hanger allowable loads are WP loads for each stirrup. Saddle hangers on stud walls do not achieve catalog loads.
- Recommended S dimension is 1/8" oversized for carrying members 2 1/2" wide and less or 1/8" oversized for greater than 2 1/2" wide.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

WMU Mid-Wall Installation
See pp. 250–251 for models and more information.

	(2) 2x	(4) 0.148 x 2 ¹ / ₂	(2) 0.148 x 1 ¹ / ₂	—	2,985	2,230	—
	3x or 4x	(4) 0.162 x 2 ¹ / ₂	(2) 0.148 x 1 ¹ / ₂	—	2,985	2,230	3,375
HWP	(2) 2x	(9) 0.148 x 3	(10) 0.148 x 1 ¹ / ₂	710	4,415	3,860	4,415
	3x	(9) 0.162 x 2 ¹ / ₂	(10) 0.148 x 1 ¹ / ₂	970	4,415	3,860	—
	4x	(9) 0.162 x 2 ¹ / ₂	(10) 0.148 x 1 ¹ / ₂	1,535	4,920	3,860	4,920
HWPH	(2) 2x	(12) 0.162 x 2 ¹ / ₂	(10) 0.148 x 1 ¹ / ₂	710	5,910	4,820	5,910
	3x	(12) 0.162 x 2 ¹ / ₂	(10) 0.148 x 1 ¹ / ₂	970	5,970	5,125	—
	4x	(12) 0.162 x 3 ¹ / ₂	(10) 0.148 x 1 ¹ / ₂	1,550	5,970	5,125	5,970

- Attachment of nailer to supporting member is the responsibility of the designer.
- Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Nailer Table

The table indicates the maximum allowable loads for WP, HWP and HWPH hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

Installation on Wood Nailer

Various Header Applications

Model	Joist (in.)		Fasteners (in.)			Allowable Loads Header Type							Code Ref.
	Width	Depth	Top	Face	Joist	Uplift (160)	LVL	PSL	LSL	DF/SP	SPF/HF	I-Joist	
WP	1 ¹ / ₂ to 7 ¹ / ₂	5 ³ / ₈ to 30	(4) 0.148 x 1 ¹ / ₂	—	(2) 0.148 x 1 ¹ / ₂	—	2,935	3,150	—	2,465	1,985	2,030	IBC®, FL, LA
	1 ¹ / ₂ to 7 ¹ / ₂	5 ³ / ₈ to 30	(4) 0.148 x 2 ¹ / ₂	—	(2) 0.148 x 1 ¹ / ₂	—	2,935	3,150	3,150	2,985	2,230	—	
	1 ¹ / ₂ to 7 ¹ / ₂	5 ³ / ₈ to 30	(4) 0.162 x 2 ¹ / ₂	—	(2) 0.148 x 1 ¹ / ₂	—	3,095	3,605	3,605	2,985	2,230	—	
HWP	1 ¹ / ₂ to 7	6 to 15 ³ / ₈	(3) 0.162 x 3 ¹ / ₂	(6) 0.162 x 3 ¹ / ₂	(10) 0.148 x 1 ¹ / ₂	1,535	3,995	4,500	4,350	3,955	3,955	—	
	1 ¹ / ₂ to 7	15 ³ / ₄ to 28	(3) 0.162 x 3 ¹ / ₂	(6) 0.162 x 3 ¹ / ₂	(12) 0.148 x 1 ¹ / ₂	1,560	3,995	4,500	4,350	3,955	3,955	—	
HWPH	1 ¹³ / ₁₆ to 7 ¹ / ₂	6 to 15 ³ / ₈	(4) 0.162 x 3 ¹ / ₂	(8) 0.162 x 3 ¹ / ₂	(10) 0.148 x 1 ¹ / ₂	1,685	6,595	7,025	5,450	5,920	4,740	—	
	1 ¹³ / ₁₆ to 7 ¹ / ₂	15 ³ / ₄ to 32	(4) 0.162 x 3 ¹ / ₂	(8) 0.162 x 3 ¹ / ₂	(12) 0.148 x 1 ¹ / ₂	2,075	6,595	7,025	5,450	5,920	4,740	—	

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load except WMU, use 0.75 x DF/SP uplift loads.
- LVL headers are assumed to be made primarily from Douglas fir or southern pine. For LVL made from spruce-pine-fir or similar less-dense veneers, use the values found in the SPF/HF column.
- For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.
- Fasteners:** Nail dimensions are listed diameter by length. Titen Turbo™ screws are Simpson Strong-Tie concrete and masonry screws. See pp. 23–24 for fastener information.

WP/HWP/HWPH

High-Capacity Top-Flange Hangers (cont.)

Modifications and Associated Load Reductions for WP/HWP/HWPH

Models	Seat							Top Flange			Top Flange and Seat				Joist Height			
	Seat Sloped 45° Max.		Seat Skewed Type A	Seat Skewed Type B		Seat Sloped and Skewed Type A 1°–45°		Top Flange Sloped 35° Max.	Top Flange Bent Open or Closed 30° Max.	Top Flange Offset		Top Flange Offset and Skewed Seat Type A, Bevel Cut 1°–45°		Top Flange Offset and Skewed Seat Type B, Plumb Cut 1°–84°		Joist Shorter Than Hanger		
	Slope Up	Slope Down	1°–45°	1°–45°	46°–84°	Up	Down			Narrow	Wide	Narrow	Wide	Narrow	Wide			
WP	1.0	1.0	1.0	1.0		1.0	1.0	(90–a)/90	(90–a)/90	0.5		0.5		0.25	0.3	By more than ½": 0.50 By ½" or less: 1.00		
HWP		0.8		N/A			0.8			0.5		0.6	0.5		0.6		N/A	
HWPH				0.8 0.7						0.5		0.6	0.5		0.6		0.5	

- For straight-line interpolation, "a" is the specified angle.
- Reduction factors are not cumulative. Use the lowest factors that apply.
- Narrow ≤ 3½", Wide > 3½".
- HWP and HWPH options receive catalog uplift loads except: top flange offset 30% of the table load, skewed type A is 75% of the table load and HWPH only skewed type B is 50% of the table load.
- Top flange bent closed is not available for HWP or HWPH.

Reduction Factor Instructions

Allowable Download = (lowest of Seat, Top Flange, or Joist Height) × (Table Load)

Allowable Uplift = as noted in table per height.

(square-cut joist shown)

Typical HWP sloped down, skewed right with type A hanger (joist end must be bevel cut).
When ordering, specify low side flush, center flush or high side flush.

HGLT/HGLTV/HGLS/GLS

Heavy-Duty Top-Flange Hangers

HGLTV hangers are designed for structural composite lumber header applications that require high loads. The top-flange nails are sized and specifically located to prevent degradation of the header due to splitting of laminations.

HGLT accommodate typical structural requirements for timber and glulam beams. Not acceptable for nailer applications. The Funnel Flange™ design allows easy installation of beams.

GLS and HGLS are heavy glulam beam saddle hangers.

For heavy loads with a face-mount application, see the HGUS and GU series.

Material: 3 gauge top flange; 7 gauge stirrup

Finish: Simpson Strong-Tie gray paint. Hot-dip galvanized is available; specify HDG.

Installation:

- Use all specified fasteners. Verify that the header can take the required fasteners specified in the table.
- For attaching to multi-ply headers, refer to technical bulletin T-C-MPLYHEADR at strongtie.com.
- Flatten edge of header to match top flange radius.
- Bevel cut the carried beam for skewed hangers.
- For hangers exceeding the joist height by more than $\frac{1}{2}$ ", allowable load is 50% of the table load.
- This series may be used for weld-on applications. Minimum required weld is a $\frac{1}{4}$ " x $2\frac{1}{2}$ " fillet weld at each end of the top flange; see p. 20, note k for weld information. Weld-on applications produce maximum loads listed. For uplift loads, refer to technical bulletin T-C-WELDUPLFT at strongtie.com.
- HGLTV hangers may be installed on ledgers provided the ledgers are made of 4x solid sawn or $3\frac{1}{2}$ " SCL shown in the table below. Thinner ledgers must be evaluated by the building designer.
- N54A nails are included with HGLT, HGLS and GLS hangers. N54A nails should only be used with solid sawn, timber, or glulam headers. For HGLS or GLS with SCL members, $\frac{1}{4}$ " x $2\frac{1}{2}$ " Strong-Drive® SDS Heavy-Duty Connector screws may be used in place of N54A nails. For HGLT, consider HGLTV as an alternative when used with SCL.
- For HGLS and GLS, loads shown are per side.
- To order GLS and HGLS, specify H₁, H₂, W₁, W₂ and S dimensions (see illustration).

Options:

- Hot-dip galvanized; specify HDG.
- HGLT/HGLTV, GLS and HGLS series seats may be skewed to a maximum of 50° and/or sloped to a maximum of 45°.
- For sloped seat, the maximum allowable load for the HGLT/HGLS/HGLTV is 9,165 lb. The maximum allowable load for the GLS is 6,550 lb.
- For skewed seat, the maximum allowable load for the HGLT/HGLS/HGLTV is 7,980 lb. The maximum allowable load for the GLS is 6,500 lb. The deflection at full loading may reach $\frac{1}{4}$ ". For skews greater than 15°, multiply the table uplift load by 0.50.
- For slope and skewed seat, the maximum allowable load is 9,650 lb. for the HGLT/HGLS and 7,695 lb. for the HGLTV. For GLS sloped and skewed seat combinations, the maximum download is 5,500 lb. per supported member. The deflection at full loading may reach $\frac{1}{4}$ ". For skews greater than 15°, multiply the table uplift load by 0.50.
- Sloped or skewed seat hangers may not be installed in non-backed header installations.
- Top flange may be sloped down to the left or right up to 30°. Reduce allowable loads using the following reduction factor based on linear interpolation $(90-\alpha)/90$; where α is the angle measure from the horizontal. This reduction is not cumulative with other load reductions.
- Top flange may be offset left or right for placement at the end of a header. Minimum seat width $3\frac{1}{4}$ ". The maximum allowable load is 0.45 for the HGLT/HGLS/HGLTV and 0.50 for the GLS. No uplift load is available. Offset top flange and sloped seat is allowed with 0.45 load factor.
- For skewed and offset or skewed only top-flange HGLS/HGLT/HGLTV hangers with inward or outward configuration, the maximum allowable load is the lesser of a) 45% of the catalog load or b) 4,300 lb. for HGLS/HGLT/HGLTV and 3,500 lb. for GLS.

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Uplift loads apply only when "H" is 28" or less.
3. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.
4. LVL headers are assumed to be made primarily from Douglas fir or southern pine.
For LVL made from spruce-pine-fir or similar less-dense veneers, use the values found in the SPF/HF column.
5. For SCL products made primarily from Douglas Fir or Southern Pine, use 1,640 lb. for uplift. For SPF members, use 1,115 lb. for uplift.
6. GLS and HGLS saddle hanger allowable loads are for each stirrup. Fasteners listed are total fasteners required.
7. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

EGQ

High-Capacity Top-Flange Hanger

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The EGQ hanger is a high-capacity top-flange connector designed for use with structural composite lumber beams. It utilizes Strong-Drive® SDS Heavy-Duty Connector screws for higher capacity and ease of installation. Available in standard SCL widths and made to specified heights. SDS screws are included.

Material: Top flange — 3 gauge; stirrups — 7 gauge

Finish: Simpson Strong-Tie gray paint; HDG available

Installation:

- Use all specified fasteners; see General Notes.
- Install with ¼" x 3" Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the EGQ. (Lag screws will not achieve the same load.)
- All multi-ply members must be fastened together per the designer.
- Multiple member headers may require additional fasteners at hanger locations. Quantity and location to be determined by designer.

Options:

Skewed Seat

- The EGQ can be skewed a maximum of 45°
- The maximum allowable download when skewed is 16,300 lb.
- The maximum allowable uplift when skewed is 5,770 lb.
- Joist must be bevel cut for skewed seat installation

Sloped Seat

- The EGQ can be sloped up or down a maximum of 45°
- The maximum allowable download when sloped is 15,360 lb.
- The allowable uplift when sloped is 100% of the table load
- Sloped seat installation requires an additional 14 joist screws (supplied with the connector)

No Sloped and Skewed Combo Available

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. "H (Min.)" is the minimum H dimension that may be specified.
3. Loads are based on 750 psi wood bearing for SCL.
4. For normal loading, such as in cantilever construction, use an uplift value of 4,800 lb.

LEG/MEG/EG

Beam and Glulam Top-Flange Hangers

Designed to support large members typically found in glulam beam construction.

Material: Stirrup — 7 gauge; LEG/MEG TF — 7 gauge; all other TF — 3 gauge

Finish: Simpson Strong-Tie gray paint. Some products available hot-dip galvanized or in black powder coat.

Installation:

- Use all specified fasteners: see General Notes
- Maintain minimum 4D end distance and edge distance from bolt to end of header and nearest loaded edge per NDS requirements

Options:**Skewed Seat — Top-Flange Models Only**

- The LEG/MEG/EG series can be skewed up to 45°. The maximum allowable load is 10,000 lb. for LEG and MEG, 14,250 lb. for EG.

Sloped Seat — Top-Flange Models Only

- The LEG/MEG/EG series can be sloped up to 45°. The maximum allowable load is 9,665 lb.; see illustration.

No Skewed and Skewed Combo Available.**Offset Top Flange**

- The LEG/MEG (only) top flange may be offset left or right for placement at the end of a header (see illustration). The maximum allowable load is 5,665 lb. (Min. H = 11" for MEG, 9" for LEG).
- No skews allowed on offset hangers.
- Models available without top flanges; see table loads.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

**LEG/MEG/EG
Without Top Flange**
(see options)

LEG and MEG

**Typical LEG/MEG
Top Flange Offset Left**

EG

**EG with "H" dimension
less than the face
plate height. The EG's
back plate is always
17 1/2", regardless
of the stirrup height.**

**Typical LEG Sloped
Down Installation**
(MEG/EG similar)

1. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.

2. Allowable loads assume a carrying member width of 5 1/8".

3. Specify H dimension.

4. Triangle Theory: Some code jurisdictions allow only half of the top-flange bearing area to be considered when performing a top-flange hanger calculation, as there is non-uniform stress under the top flange (presumed to be a triangular-shaped distribution). Therefore, loads are published above using the calculated "Triangle Theory." Loads are also published in the "No Triangle Theory" columns, which are based on calculations assuming full bearing on the top flange which do not exceed the tested value with a reduction factor of 3.

MSC

Multiple-Seat Top-Flange Connector

The MSC supports the ridge and two valleys for roof construction. Ideal for dormer roof applications.

Material: Top flange — 3 gauge; stirrups — 11 gauge (MSC2 and MSC1.81), 7 gauge (MSC4 and MSC5)

Finish: Simpson Strong-Tie gray paint; HDG available

Installation:

- Distribute the total load evenly about the centerline to avoid eccentric loading
- Fasten all built-up members together as one unit
- Net height will be calculated based on specified valley member depth and slope by the factory unless noted otherwise

Sloped and/or Skewed Valleys

- The valley stirrups can be sloped down to 45° and skewed from 25° to 45°. (MSC5 skewed 20°–45°.)
- Reminder: Hip and valley slopes are typically much different than roof slopes. See strongtie.com Slope and Skew Calculator for assistance in computing slopes and skews.
- The total design load of the hanger is split between the ridge (20%) and each valley (40%).
- MSC connectors can be used for two valley connections with no ridge member. Divide the total load by two for each valley load.
- Hip/valley connections and many combinations of joist sizes, slopes and skews can be manufactured (refer to technical bulletin T-C-MSC-WS at strongtie.com).

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

							(26) 0.162 x 3 ¹ / ₂		45°	5,630	2,815	14,075	

1. Valley loads are for each valley.
2. Other valley-ridge load distributions are allowed, provided the load sum of all three carried members is distributed symmetrically about the center of the hanger and combined does not exceed the total load.
3. MSC4 is also available in 3¹/₈" glulam width.
4. MSC5 is also available in widths up to 5¹/₂". W₂ minimum width is 3¹/₈".
5. MSC4 is also available in widths down to 1³/₁₆". Use 0.148" x 1¹/₂" nails and MSC2 allowable loads.
6. Refer to technical bulletin T-C-MSC-WS at strongtie.com for the hip/valley rafter roof pitch conversion table.
7. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

MSC4 with Valley Sloped and Skewed 45°

MSC1.81 with Valley Skewed 45° and Sloped 0°

Typical MSC4 Installation

1. Loads may not be increased for duration of load.
2. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
3. Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.
4. When an I-joist is used as header, all nails must be 0.148" x 1 1/2", and allowable loads assume flanges that are at least 1 1/2" thick and made of Douglas fir, LVL, or LSL. For other flange thicknesses, apply load adjustment factors found in the table below.
5. Hangers sorted in order of recommended selection for best overall performance and installation value.
6. Other nail schedules and loads are listed on product pages.
7. Web stiffeners are required where noted, when hanger is sloped or skewed, and when it supports double I-joists with flanges less than 1 3/8" thick in hangers that are 14 gauge and thinner.
8. HGLS saddle hanger allowable loads are for each stirrup. Joist fasteners listed are for one side only. Fasteners are provided for both sides of the saddle.
9. **Fasteners:** Nail dimensions are listed diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive® SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

I-Joist Header Load Adjustment Factors					
Flange Material or Thickness	Hanger Series				
	ITS	MIT	LBV	WP	BA
1 1/8" to 1 1/4"	0.75	0.75	0.75	0.75	0.75
1 1/8" to 1 3/8"	0.85	0.85	0.85	0.85	0.85
SPF	0.86	0.72	0.90	1.00	1.00

VB

Knee Brace

The VB provides lateral resistance force at the bottom of beams when installed approximately 45° or more to the vertical plane.

Material: 12 gauge

Finish: Galvanized

Installation:

- Use specified fasteners; see General Notes
- 16-N54A fasteners are included with the brace
- 1/4" x 2 1/2" Strong-Drive® SDS Heavy-Duty Connector screws may be used in place of N54A nails

Codes: See p. 13 for Code Reference Key Chart

Model No.	H (Beam Depth) (in.)	L (ft.)	Fasteners (Total)	Allowable Tension Loads			Code Ref.
				Floor (100)	Roof (125)	Roof (160)

1. **Fasteners:** See pp. 23–24 for fastener information.

HCA

Hinge Connectors

Hinge connectors are designed to transfer loads between two beams aligned end-to-end through a combination of bearing plates, side plates and bolts. In addition to supporting vertical loads, hinge connectors can also be specified with additional slotted bolt holes to resist horizontal loads as part of a continuous load path.

Material: Side plates — 7 gauge; top and bottom plates — see PT dimensions in table

Finish: Simpson Strong-Tie gray paint

Installation: • Use all specified fasteners; see General Notes

- Bolt holes shall be a minimum of $\frac{1}{16}$ " and a maximum of $\frac{1}{8}$ " larger than the bolt diameter (per 2015/2018 NDS 12.1.3.2)
- The model size (suffix) column in the Allowable Download table gives the basic HCA model with two rotation bolts
- Contact Simpson Strong-Tie for heights greater than 60"
- Position $\frac{3}{4}$ "-diameter bolts in slots away from bearing seat to allow for wood shrinkage
- For retrofit hinge connector strap applications, see strongtie.com.

Options: • The Horizontal Load table gives other bolt options

Ordering: • To order, specify model no., model size, and height H. Add the width (W) and bearing plate size (PD) designation after the model name. Specify the H dimension; example: HC4C3TA5-6 H = 18".

- For dapped beams, reduce the H dimension by the PT dimension for each dap. See strongtie.com/dap.

Codes: See p. 13 for Code Reference Key Chart

HC4C3TA
Top of carrying beam dapped the PT thickness for flush installation

Model No. (Prefix)	Dimensions (in.)			Rotation Bolts per Beam	Slotted Tension Bolts	Allowable Horizontal Loads ^{1,2} (160)
	L	H ³ Min.	H Max.			
HCA	19½	8	60	2	—	—
HCCTA	19½	14	60	2	3	14,850
HC3A	25½	8	60	3	—	—
HC4C3TA	25½	14	60	3	4	19,720

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. Horizontal loads are for Douglas fir-larch glulams with minimum W = 3½". For other wood types, adjust the load according to the code.
3. H min. is the absolute minimum height. Reduce downloads according to footnote 1 in the Allowable Roof Download table.

1. Loads are based on 560 psi perpendicular-to-grain bearing stress.
2. H₁ is the minimum dimension required to achieve full load for the hinge connector. For H dimensions between H₁ and Minimum H, loads may be linearly interpolated.
3. See Horizontal Load table for models available with three rotation bolts.
4. Beams must be the same width for both members in the connection.

HCCTA

HCA

HC3A

GLB/HGLB

Beam Seats

The GLB series provides a connection between beam and concrete or CMU pilaster.

Finish: Simpson Strong-Tie gray paint. Hot-dip galvanized available; specify HDG.

Installation:

- Use all specified fasteners; see General Notes
- Bolt holes in wood shall be a minimum of $\frac{1}{32}$ " to a maximum of $\frac{1}{16}$ " larger than the bolt diameter (per the 2015/2018 NDS, section 12.1.3.2)
- Check the rebar spacing requirements on all installations

Options:

- Beam seats for sawn timber and other sizes may be ordered by specifying special dimensions; use the letter designations shown on the illustrations
- Specify if two-bolt GLB model is desired; see illustration

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

- Allowable bearing stress for masonry is based on an f'_c of 1,500 psi using the IBC (TMS 402) Allowable Stress Design. Wood bearing is based on an $F_{c\perp}$ of 650 psi.
- When installing on masonry, use the lesser of the masonry or the wood allowable load values. When installing on concrete, use a minimum $f'_c = 2,500$ psi and use the wood values as the limiting allowable bearing load values.
- Allowable horizontal loads are bolt values and include increase for wind or earthquake loading. **Design of the concrete or masonry and the anchorage of the GLB connector must be in accordance with the applicable provisions of the code.**
- Beams must fully bear on base plate.
- Specify "W" dimension when ordering.
- Uplift loads do not apply for this connector.

Mass Timber Connection Solutions

Simpson Strong-Tie offers a wide range of connector and fastener solutions for mass timber construction.

THA/THAC

Adjustable Truss Hangers

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The THA series have extra long straps that can be field-formed to give height adjustability and top-flange hanger convenience. THA hangers can be installed as top-flange or face-mount hangers.

THA4x and THA2x-2 models feature a dense nail pattern in the straps, which provides more installation options and allows for easy top-flange installation.

Material: See table

Finish: Galvanized. Some products available in ZMAX® coating or HDG.

Installation:

- Use all specified fasteners; see General Notes.

The following installation methods may be used:

- **Top-Flange Installation** — The straps must be field-formed over the header 2" minimum (2 7/16" for the THA29). Install top and face nails according to the table. Top nails shall not be within 1/4" from the edge of the top-flange members. For top-flange (min.) installations (not applicable to the THA29), straighten the double-shear nailing tabs and install the nails straight into the joist. For top-flange (max.) installations, nails used for joist attachment must be driven at an angle so that they penetrate through the joist and into the header (requires full backing), and the lowest four face holes must be filled.
- **Face-Mount (Min.) Installation** — Install face nails according to the table, with at least half of the required fasteners in the top half of the header. Not all nail holes in the straps will be filled. Nails must have a minimum 1/2" edge distance. Straighten the double-shear nailing tabs and install the joist nails straight into the joist. The face-mount (min.) installation option accommodates conditions where the supported member hangs either partially or entirely below the header.
- **Face-Mount (Max.) Installation** — Install face nails according to the table. Not all nail holes in the straps will be filled except for the following models: THA29, THA213, THA218 and THA413. For all other models with more nail holes than required, the straps may be installed straight or wrapped over the header, with the tabulated quantity of face nails installed into the face and top of the header. The lowest four face holes must be filled. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.
- **Uplift** — Lowest face nails must be filled to achieve uplift loads.

Options:

- THA hangers available with the header flanges turned in for 3 5/8" (except THA413) and wider, with no load reduction — order THAC hanger.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Wind (160) is a download rating.

3. Top flange installation loads are based on a minimum two-ply 2x carrying member. For top flange (min.) installation on 4x2 truss carrying members with double top chords, use the specified fasteners for full tabulated values; for single 4x2 top chord or nailer applications, refer to the Nailer Table.

4. Face-mount installation loads are based on a two-ply 2x carrying member minimum. For single 2x carrying members, use 0.148" x 1½" nails in the carrying member and tabulated fasteners in the carried member, and use 0.80 of the table value for 18 gauge, and 0.68 of the table value for 16 gauge and 14 gauge.

5. For the THA 2x models, one strap may be installed vertically according to the face-mount nailing requirements and the other strap wrapped over the truss chord according to the top-flange (min.) nailing requirements (see drawing on p. 200) and achieve full tabulated top flange (min.) installation loads.

6. Refer to installation instructions regarding fastener installation into carried (joist) member. Based on the installation condition, nails will be installed either straight with straightened double-shear nailing tabs or slanted.

7. THA29 may be installed on a single 2x6 or 2x8 carrying member using (2) 0.148" x 3" top nails, (6) 0.148" x 3" face nails and (4) 0.148" x 3" slant nails with an allowable download of 2,020 lb. for DF/SP and 1,500 lb. for SPF/HF.

8. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

- Loads for 2x Nailers are applicable to single 4x2 top chord carrying members provided:
 - the hanger is located at a top chord panel point; 2) there is no splice at that panel point location;
 - the floor truss girder must have adequate lateral bracing to prevent excessive displacement due to secondary torsional stresses (refer to ANSI/TPI 1-2014, Section 7.5.3.5).
- Attachment of nailer to supporting member is the responsibility of the designer.
- Refer to table on p. 201 for hanger dimensions, minimum top flange requirements and additional footnotes.

Allowable Loads for Face-Mount (Min.) Nailing Installation

Model No.	Ga.	Dimensions (in.)		Fasteners (in.)		Allowable Loads (lb.)

THA422	16	3 1/2	22	(20) 0.148 x 3	(6) 0.148 x 1 1/2	2,440	2,485	2,485	2,100	2,140	2,140
THA426	14	3 1/2	26	(30) 0.148 x 3	(6) 0.148 x 1 1/2	3,225	3,225	3,225	2,770	2,770	2,770

- Loads are based on a min. 2-ply 2x carrying member. 0.148" x 2 1/2" nails may be used instead of the specified 10d commons at 1.00 of the table load. For single-ply 2x or 1 3/4" wide carrying members, use 0.148" x 1 1/2" nails and use 0.77 of the table value. Alternately, #9 x 1 1/2" Strong-Drive® SD Connector screws may be used in place of the specified header and joist nails for full table loads.
- The joist nails should be installed straight into the carried member by straightening the THA double shear nailing tabs. When used to support 2x4 joists, the THA213 or THA218 may be installed with (2) 0.148" x 1 1/2" nails into the joist (one each side).
- At least half of the face fasteners must be installed into the upper half of the header, unless some other means of mechanical reinforcement is used to resist the tension perpendicular to grain stresses. Nails must have a minimum 1/2" edge distance.
- For installations with fewer face fasteners than specified, reduce the allowable load as follows: Allowable load = No. of Face Nails Used/No. Face Nails in Table x Table Load.
- Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23-24 for fastener information.

**Typical THA Face-Mount
Min. Nailing Installation for
Supporting a Suspended Joist**

Visit app.strongtie.com/hs to access our Hanger Selector web application.

THAR/L422

Adjustable Skewed Truss Hanger

Designed for 4x2 floor trusses and 4x beams, the THAR/L422 has a standard skew of 45°. Straps must be bent for top flange installation. Positive-angle nailing (PAN) helps eliminate splitting of 4x2 truss bottom chords.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- Straps must be field-formed over the header a minimum of 2½"
- Minimum and maximum nailing configurations available — see table for nailing requirements

Codes: See p. 13 for Code Reference Key Chart

Web Applications:
Visit app.strongtie.com/hs to access our Hanger Selector web application.

THAL422

Typical THAR/L422 Installation with Minimum Nailing on a Floor Truss with Double 4x2 Top Chord

Model No.	Ga.	Dimensions (in.)			Min. Top Chord on Carrying Member	Effective Height Heff ³	Fasteners (in.)				DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
3. Where the top of the carried member is flush with the top of the carrying member, Heff is equal to the depth of the carried member. Otherwise, Heff shall be measured from the top of the bearing seat to the top of the carrying member.
4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

THASR/L

Adjustable/Skewable Truss Hangers

The THASR/L hangers combine the height adjustability of THA hangers with field skewability, offering maximum flexibility for the installer, and eliminating the need for special orders. Shipped at 22½° right or left, the THASR/L hangers can be field skewed from 22½° to 75° (up to 85° for the THASR/L29 and THASR/L29-2).

Features:

- The THASR/L single and two-ply versions have straps 9" tall. The 4x version has 22" straps to fit more parallel-chord truss applications.
- The versions have only one acute side bend line to ease design and installation.
- Joist fasteners are only required from one side for skews greater than 22½°.
- Rated for installation with either nails or Strong-Drive® SD Connector screws.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Product is factory skewed to 22½° and may be field skewed from 22½° to 75° (up to 85° for the THASR/L29 and THASR/L29-2). See Installation Sequence below for skews greater than 22½°.
- For 22½° skew installations, fill all triangle holes. Triangle holes do not need to be filled for skews greater than 22½°.
- For all installations, fill the fastener hole(s) in the bottom of the hanger seat (THASR/L29 has one and all other models have two).
- For top-flange installations, the straps must be field-formed over the header a minimum of 2".
- THASR/L29 and THASR/L29-2 — For installations where either strap cannot be field-formed over the header, install the strap(s) vertical and fill all holes. Loads must be reduced as noted in the table footnotes.
- THASR/L422 — For face-mount installations, install the carrying member fasteners into the lowest holes.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

THASL29

Typical THASL29 Installation

(L in model name = Left, R in model name = Right)

Typical THASL29 Installed with One Strap Vertical

Installation Sequence for Skews > 22½°

Step 1

Install acute side top and/or face header fasteners.

Step 2

Utilizing a piece of scrap fastened to the hanger (on obtuse side only), bend the hanger along the acute side bend line to the desired angle.

Step 3

Bend the obtuse side of the hanger back toward the header until the narrow nailing flange lies flat against the header, and install obtuse side header top and/or face fasteners.

Step 4

Install joist/truss and install the carried member fasteners on the obtuse side and seat only.

THASR/L

Adjustable/Skewable Truss Hangers (cont.)

These products are available with additional corrosion protection. For more information, see p. 16.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Wind (160) is a download rating.
3. Minimum carried member heel height shall be 4½".
4. Heff is the distance from the top of the hanger seat to the top of the carrying member.
5. For tabulated top-flange installation loads, the straps must be wrapped over the header a minimum of 2". Allowable downloads for the THASR/L29 and THASR/L29-2 with one or both straps installed vertically (all holes filled) are 90% of the tabulated downloads for skews greater than 22½° and 85% of the tabulated downloads for 22½° skews. Allowable uplift capacities are 100% of the tabulated uplift load capacities.
6. Allowable downloads for 75°–85° skews with one or both straps installed vertically (with all holes filled) shall be limited to 75% of these loads.
7. **Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

Heavy Severe Skew Truss Hanger

The HHSUQ is a high-load, face-mount, truss-to-truss hanger designed to accommodate severe skew angles (45°–84°) for hip trusses, enabling a greater range of installation applications. Fastening the HHSUQ with Strong-Drive® SDS Heavy-Duty Connector screws makes installation fast and easy, while eliminating the inconvenience of bolted applications.

Material: Back plate — 3 gauge; stirrup — 7 gauge

Finish: Simpson Strong-Tie gray paint

Installation: • Use all specified fasteners; see General Notes.

- The joist/truss end may be square cut or bevel cut. 3/8" minimum heel height.
- Strong-Drive SDS Heavy-Duty Connector screws supplied for all round holes.
- All multi-ply members must be fastened together to act as a single unit.

To Order: Left or right skew must be specified.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Strong-Drive SDS Heavy-Duty Connector screws that penetrate all plies of the supporting girder (screws must penetrate a minimum of 1" into the last truss ply) may also be used to transfer the load through all the plies of the supporting girder. When SDS Heavy-Duty Connector screws do not penetrate all plies of the supporting girder truss, supplemental SDS screws at the hanger locations may be required to transfer the load to the truss plies not penetrated by the face fasteners, as determined by the designer. 3"-long SDS screws in the face may be replaced with 4 1/2"- or 6"-long SDS screws with no load reduction.
3. Loads shown are based on a minimum two-ply 2x8 carrying member. For single 2x carrying members, replace 3"-long Strong-Drive SDS Heavy-Duty Connector screws with 1 1/2"-long SDS screws and reduce the allowable download to 2,630 lb. for DF/SP and 1,895 lb. for SPF/HF. The tabulated allowable uplift load is not reduced.
4. Girders must have adequate lateral bracing to prevent excessive displacement due to secondary torsional stresses. (Refer to ANSI/TPI 1-2014, Section 7.5.3.5.)
5. Truss chord cross-grain tension may limit allowable loads. Designer to refer to ANSI/TPI, Section 7.5.3.2 for connection details, limitations, and reductions.
6. Strong-Drive SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a 5/8" bit maximum).
7. For installations into LSL or PSL, use DF/SP table loads.
8. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

LUS/MUS/HUS/HHUS/HGUS™

Face-Mount Joist Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The double-shear hanger series, ranging from the light-capacity LUS hangers to the highest-capacity HGUS hangers, feature innovative double-shear nailing that distributes the load through two points on each joist nail for greater strength. This allows for fewer nails, faster installation and the use of all common nails for the same connection.

For medium-load truss applications, the MUS offers a lower-cost alternative and easier installation than the HUS or THA hangers, while providing greater load capacity and bearing than the LUS.

Material: See tables on pp. 208–209

Finish: Galvanized. Some products available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes
- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads
- Not designed for welded or nailer applications

Options:

- LUS and MUS hangers cannot be modified
- Concealed flanges are not available for HGUS and HHUS
- Other sizes available; consult your Simpson Strong-Tie representative

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. For dimensions and fastener information, see table above. See table footnotes on p. 209.

HHUS/HGUS

See Hanger Options information on pp. 101–103.

HHUS — Sloped and/or Skewed Seat

- HHUS hangers can be skewed to a maximum of 45° and/or sloped to a maximum of 45°
- For skew only, maximum allowable download is 0.85 of the table load
- For sloped only or sloped and skewed hangers, the maximum allowable download is 0.65 of the table load
- Uplift loads for sloped/skewed conditions are 0.72 of the table load, not to exceed 2,475 lb.
- The joist must be bevel-cut to allow for double shear nailing

HGUS — Skewed Seat

- HGUS hangers can be skewed to a maximum of 45°. Allowable load adjustment factors are:

HGUS Seat Width	Carried Member End Condition			
	Square Cut		Bevel Cut	
	Uplift	Download	Uplift	Download
W < 2"	0.46	0.62	0.46	0.72
2" < W < 6"	0.41	0.46	0.41	0.85
6" < W < 6.75"		0.40		
6.75" < W < 7.25"	Not allowed	Not allowed		

Top View HHUS Hanger Skewed Right
(joist must be bevel cut)
 All joist nails installed on the outside angle (non-acute side).

LUS/MUS/HUS/HHUS/HGUS™

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Wind (160) is a download rating.
- Minimum heel height shown is required to achieve full table loads. For less than minimum heel height, see technical bulletin T-C-REDHEEL at strongtie.com.
- Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. The Simpson Strong-Tie [Hanger Selector web application](#) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
- Loads shown are based on a two-ply 2x carrying member minimum for nailed hangers. With 3x carrying members: when 0.162" x 3½" nails are specified, use 0.162" x 2½" nails into the header and 0.162" x 3½" nails into the joist with no load reduction. When 0.148" x 3" nails are specified, use 0.148" x 2½" nails into the header and 0.148" x 3" nails into the joist with no load reduction. With 2x carrying members: when 0.162" x 3½" nails are specified, use 0.148" x 1½" nails into the header and 0.148" x 3" nails into the joist and reduce the load to 0.64 of the table values. When 0.148" x 3" nails are specified, use 0.148" x 1½" nails into the header and 0.148" x 3" nails into the joist and reduce the load to 0.77 of the table values.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

HTU

Face-Mount Truss Hanger

The HTU face-mount truss hanger has nail patterns designed specifically for shallow heel heights, so that full allowable loads (with minimum nailing) apply to heel heights as low as 3 $\frac{3}{8}$ ". Minimum and maximum nailing options provide solutions for varying heel heights and end conditions.

Alternate allowable loads are provided for gaps between the end of the truss and the carrying member up to 1 $\frac{1}{2}$ " max. to allow for greater construction tolerances (maximum gap for standard allowable loads is 1 $\frac{1}{8}$ " per ASTM D7147). See technical bulletin T-C-HANGERGAP at strongtie.com for more information.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- Can be installed filling round holes only, or filling round and triangle holes for maximum values
- See alternate installation for applications using the HTU26 on a 2x4 carrying member or HTU28 or HTU210 on a 2x6 carrying member for additional uplift capacity

Options:

- HTU may be skewed up to 67 $\frac{1}{2}$ °. See Hanger Options on p. 212 for allowable loads.
- See engineering letter L-C-HTUSD at strongtie.com for installation with Strong-Drive® SD Connector screws.

Codes: See p. 13 for Code Reference Key Chart

Web Applications:
Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. The maximum hanger gap is measured between the joist (or truss) end and the carrying member.
2. Minimum heel heights required for full table loads are based on a minimum 2:12 pitch.
3. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
4. Wind (160) is a download rating.
5. For hanger gaps between 1 $\frac{1}{8}$ " and 1 $\frac{1}{2}$ ", use the Alternate Allowable Loads.
6. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie [Hanger Selector web application](http://strongtie.com) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
7. Loads shown are based on a minimum two-ply 2x carrying member. For single 2x carrying members, use 0.148" x 1 $\frac{1}{2}$ " nails in the header and reduce the allowable download to 0.70 of the table value. The allowable uplift is 100% of the table load.
8. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

HTU

Face-Mount Truss Hanger (cont.)

Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

HTU210-2 (Max.)	9¼	3⅞	9⅞	3½	(32) 0.162 x 3½	(32) 0.148 x 3	3,855	4,705	5,310	5,730	6,470	3,315	3,530	3,980	4,300	4,855	

1. The maximum hanger gap is measured between the joist (or truss) end and the carrying member.

2. Minimum heel heights required for full table loads are based on a minimum 2:12 pitch.

3. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

4. Wind (160) is a download rating.

5. For hanger gaps between 1/8" and 1/2", use the Alternative Allowable Loads.

6. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie [Hanger Selector web application](#) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.

7. Loads shown are based on a minimum two-ply 2x carrying member. For single 2x carrying members, use 0.148" x 1 1/2" nails in the header and reduce the allowable download to 0.70 of the table value. The allowable uplift is 100% of the table load.

8. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Visit app.strongtie.com/hs to access our Hanger Selector web application.

HTU

Face-Mount Truss Hanger (cont.)

Options: See Hanger Options information on pp. 101–103.

Skewed Seat

- Skewable up to 67½°
- Available in single and two-ply size
- No bevel cut required

Allowable Loads for Skewed HTU Hangers

web application.

WP/HWP/HWPH

Plated Truss Top-Flange Hangers

The WP hangers offer design flexibility and versatility supporting trusses off of wood or steel. WMU hangers are designed for use on standard 8" grouted masonry block wall construction.

Material: WP/HWP — 7-gauge top flange and 12-gauge stirrup;
HWPH — 3-gauge top flange and 7-gauge stirrup

Finish: Simpson Strong-Tie gray paint; hot-dip galvanized available: specify HDG.

Installation:

- Use all specified fasteners.
- The WP may be used for weld-on applications. The minimum size weld is a 1 1/2" long fillet weld to each side of the top flange; weld size to match hanger material thickness. See p. 20 note k for weld information. Weld-on applications have the maximum allowable capacity listed. Uplift loads do not apply to this application.
- Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.

Options:

- For hanger modification options, see table on p. 134.
- For skewed trusses using the WP hanger, order the Type B stirrup for proper bearing
- For 4x2 trusses, the ANP nail pattern may be ordered with WP hangers, which will relocate the joist nails to the top and bottom chords.
- For concrete and masonry applications, see pp. 250–251 for WMU top-flange hanger.

Saddle Hanger (WPD)

- WPD saddle hanger allowable loads are WP loads for each stirrup. Saddle hangers on stud walls do not achieve catalog loads.
- Recommended S dimension is 1/8" oversized for carrying members 2 1/2" wide and less or 1/8" oversized for greater than 2 1/2" wide.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

Typical WP Installation for 4x2 Truss

Typical WPD Saddle Hanger Installation

Nailer Table

The table indicates the maximum allowable loads for WP, HWP and HWPH hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

Model	Nailer	Fasteners (in.)		Uplift ¹ (160)	Allowable Down Loads		
		Header	Joist		DF/SP	SPF/HF	LSL
WP	2x	(4) 0.148 x 1 1/2	(2) 0.148 x 1 1/2	—	2,465	1,985	3,150
	(2) 2x	(4) 0.148 x 2 1/2	(2) 0.148 x 1 1/2	—	2,985	2,230	—
	3x or 4x	(4) 0.162 x 2 1/2	(2) 0.148 x 1 1/2	—	2,985	2,230	3,375
HWP	(2) 2x	(9) 0.148 x 3	(10) 0.148 x 1 1/2	710	4,415	3,860	4,415
	3x	(9) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	970	4,415	3,860	—
	4x	(9) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	1,535	4,920	3,860	4,920
HWPH	(2) 2x	(12) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	710	5,910	4,820	5,910
	3x	(12) 0.162 x 2 1/2	(10) 0.148 x 1 1/2	970	5,970	5,125	—
	4x	(12) 0.162 x 3 1/2	(10) 0.148 x 1 1/2	1,550	5,970	5,125	5,970

- Attachment of nailer to supporting member is the responsibility of the designer.
- Uplift loads are based on DF/SP lumber. For SPF/HF, use 0.86 x DF/SP uplift load.

These products are available with additional corrosion protection. For more information, see p. 16.

Various Headers

Model	Joist (in.)		Fasteners (in.)			Allowable Loads Header Type								Code Ref.
	Width ²	Depth	Top	Face	Joist	Uplift (160)	LVL	PSL	LSL	DF/SP	SPF/HF	I-Joist	GFCMU

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Joist dimensions do not include truss plate thickness.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

VTCR

Single-Sided Valley Truss Clip

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The VTCR is a single-sided valley truss clip that provides a positive connection between the valley truss and the supporting framing below. Installed on top of the roof sheathing, it eliminates the need to add a support wedge under the valley truss or to bevel the bottom chord to match the roof pitch.

- Single-sided for new construction or retrofit applications — can be installed after the valley truss is set in place
- Accommodates pitches from 0/12 to 12/12
- Can be installed on either beveled or non-beveled bottom chords
- Installs with nails or Strong-Drive® SD Connector screws

Material: 18 gauge **Finish:** Galvanized

Installation:

- The dome holes assist in installing the fasteners into the supporting framing at approximately 45°

Codes: See p. 13 for Code Reference Key Chart

SD Many of these products are approved for installation with Strong-Drive SD Connector screws. See pp. 362–366 for more information.

Model No.	Fasteners (in.)		Supporting Roof Pitch	DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
	Supporting Framing	Valley Truss		Uplift ³ (160)	Download ⁵ (100/115/125/160)	Uplift ³ (160)	Download ⁶ (100/115/125/160)	
VTCR	(4) 0.148 x 3	(3) 0.148 x 1 1/2	up to 12/12	370	790	320	655	IBC®, FL
	(4) #9 x 2 1/2" SD	(3) #9 x 1 1/2" SD	< 4/12	390	790	335	655	
			4/12 to 12/12	495	790	425	655	

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Loads are based on installation over 7/16" or 15/32" sheathing. For installation over 19/32" or 5/8" sheathing, allowable uplift loads are 285 lb. (DF/SP) and 245 lb. (SPF/HF) when installed with nails, or 370 lb. (DF/SP) and 320 lb. (SPF/HF) when installed with screws.
3. When attached directly to the supporting framing (**without sheathing**) with either screws or nails, the allowable uplift for pitches less than 4/12 is 240 lb. (DF/SP) and 205 lb. (SPF/HF). For pitches 4/12 to 12/12, use the tabulated uplift loads.
4. Allowable uplift loads are based on the lower of the test loads at 3/16" deflection or the ultimate load divided by a safety factor of three.
5. Southern pine allowable download is 750 lb.
6. Hem-fir allowable download is 625 lb.
7. When the valley truss and supporting framing are of different species, use the lower tabulated values.
8. **Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

TJC

Jack Truss Connector

TJC is a versatile connector for jack trusses. Adjustable from 0 to 85 degree (shipped with 67.5 degree bend). Nail hole locations allow for easy installation. Minimum nailing option on TJC37 provides faster installation and lower installed cost.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- TJC37 can be installed filling round holes only, or filling round and triangle holes for maximum values.
- To reduce the potential for splitting, install the TJC with a minimum $\frac{3}{16}$ " edge distance on the chord members.
- Position the jack truss on the inside of the bend line with the end of the jack truss flush with the bend line.
- Bend the TJC to the desired position (one bend cycle only).
- No bevel cut required.
- Attachment of TJC to the top chord requires the designer to check connection geometry for placement on both carried and carrying chord members. See Top Chord Member Sizes table on p. 216 for suggested chord sizes.
- Supported jack member is a single 2x.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

LTHMA™

Light-Duty Multiple-Truss Hanger

A light-capacity hanger designed to carry two or three single-ply trusses in a terminal hip installation. Hip trusses are at 45°.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- The total load must be symmetrically distributed about the centerline to avoid eccentric loading of the connector
- Fill round holes for girder trusses with 2x4 bottom chords
- Fill round and triangle holes for girder trusses with 2x6 bottom chords

Codes: See p. 13 for Code Reference Key Chart

Model No.	Header	Fasteners (in.)			DF/SP Allowable Loads												Code Ref.

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Hip loads are for each hip.
3. Load distribution is 45% for each hip and 10% for jack. Other hip-jack load distributions are allowed if the load sum for all three carried members does not exceed the total load and the hip members are equally loaded.
4. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie [Hanger Selector web application](#) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical LTHMA Installation
(terminal hip truss condition)

THJM

Multiple-Truss Hip/Jack Hanger

The THJM is a non-welded hanger designed to carry radial-end jack framing and provide optimal efficiency for those multi-plane, angled bay roofs over breakfast, study and library alcoves. The unique patented design of the THJM accommodates 2x4 girder bottom chords and uses our Strong-Drive® SDS Heavy-Duty Connector screws for easy installation with minimal fasteners.

Features:

- The THJM hangers are designed for installation with 1/4" x 3" Strong-Drive SDS Heavy-Duty Connector screws that are included with the parts.
- The THJM2-4-SDS3 is designed for four incoming jack trusses with the outer jacks being 22½° from the face of the girder and the inner jacks being 45° from each other and the outer jacks.
- The THJM2-5-SDS3 is designed for five jacks coming into the hanger at 30° from the girder and each other.
- Tabs on the seats of the THJM assist in the placement of the jacks and also include obround holes for optional slant nails (0.148" x 1½") when increased uplift is required.

Material: 12 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Each carried jack truss requires one 1/4" x 3" Strong-Drive SDS Heavy-Duty Connector screw installed into the bottom chord through the bottom of the hanger seat.
- For installation on girders with 2x6 or 2x8 bottom chords, install one additional 1/4" x 3" Strong-Drive SDS Heavy-Duty Connector screw in the triangular hole on each vertical strap.
- Install two 0.148" x 1½" slant nails in the obround holes on each of the seat tabs to achieve the additional uplift load noted in the footnote.

Codes: See p. 13 for Code Reference Key Chart

Model No.	SDS Fasteners		DF/SP Allowable Loads					SPF/HF Allowable Loads				Code Ref.	
	Carrying Member ³	Carried Members (Total)	Total Uplift (160) ⁶	Total Download				Total Uplift (160) ⁶	Total Download				
				Floor (100)	Snow (115)	Roof (125)	Wind (160)		Floor (100)	Snow (115)	Roof (125)		Wind (160)
THJM2-4-SDS3	(8) ¼" x 1 ½"	(4) ¼" x 3"	535	2,000	2,300	2,500	2,585	535	1,440	1,655	1,800	1,865	IBC®, FL
	(8) ¼" x 3"	(4) ¼" x 3"	535	3,140	3,140	3,140	3,140	535	2,400	2,635	2,635	2,635	
THJM2-5-SDS3	(8) ¼" x 1 ½"	(5) ¼" x 3"	590	2,000	2,300	2,500	2,585	445	1,440	1,665	1,800	1,865	
	(8) ¼" x 3"	(5) ¼" x 3"	590	3,360	3,630	3,630	3,630	445	2,400	2,620	2,620	2,620	

- Tabulated loads are the total allowable loads of all carried members combined; the load on any single carried member shall not exceed 25% of the total published load for the THJM2-4 or 20% of the total published load for the THJM2-5.
- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- A minimum two-ply carrying member is required for the 1/4" x 3" Strong-Drive SDS Heavy-Duty Connector screws (provided). For single 2x carrying members, use 1/4" x 1 1/2" SDS screws (sold separately) with corresponding loads.
- Truss chord cross-grain tension may limit allowable loads per ANSI/TPI 1-2014. The optional triangle holes may be used for installation on 2x6 and larger carrying members, for a total of 10 fasteners into the carrying member, to resist cross-grain tension forces when no other mechanical reinforcement is available.
- Tabs on the seats of the THJM hangers have obround holes for optional 0.148" x 1½" slant nails (two per carried member) when additional uplift load is required. Total allowable uplift with the optional 0.148" x 1½" slant nailing is 760 lb. (DF/SP/SPF/HF).
- Strong-Drive SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a 3/32" bit maximum).

THJU

Multiple-Truss Hip/Jack Hanger

The THJU hip/jack hanger offers the most flexibility and ease of installation without sacrificing performance. The U-shaped hanger works for right- and left-hand hips and can be ordered to fit a range of hip skews (up to 67½°) as well as various single and 2-ply hip/jack combinations. Also can be installed before or after the hip and jack.

THJU26 is sized for the standard hip/jack combination with a 45° left- or right-hand hip. The wide seat of THJU26-W accommodates a 2-ply hip and 2-ply jack combination with a 45° maximum hip skew, or a standard single-ply hip/jack configuration with a maximum 67½° hip skew. Intermediate seat widths are available for other hip/jack or hip/hip combinations.

Material: 12 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes

Options:

- THJU is available in intermediate seat widths between 5½" (THJU26 width) and 8½" (THJU26-W width) with no load reduction.
- For double-hip installation, divide the total allowable load by 2 to determine the allowable load for each hip. Order as THJU26X and specify width; see table for reference.
- Allowable download and uplift for all intermediate widths is 100% of the THJU26-W table loads.

Codes: See p. 13 for Code Reference Key Chart

- Tabulated loads are the total allowable loads of the hip and jack members combined; 65%–85% of the total load shall be distributed to the hip member, and the remaining percentage of the total load shall be distributed to the jack. The combined hip and jack load may not exceed the published total load.
- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- The jack requires either a minimum 2x6 bottom chord or a minimum 2x4 end vertical; the hip requires either a minimum 2x6 bottom chord or a minimum 2x6 end vertical for hip skews up to 60°. For hip skews greater than 60° (THJU26-W only), a minimum 2x6 bottom chord or minimum 2x8 end vertical is required.
- With single 2x carrying members, use 0.148" x 1½" nails and use 100% of the table value.
- For single 2x jacks, 0.148" x 1½" nails may be substituted for the specified 0.148" x 3" with no reduction in load.
- Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie [Hanger Selector web application](http://app.strongtie.com/hs) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

THJA26/LTHJA26

Multiple-Truss Hip/Jack Hanger

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The versatile THJA26 can accommodate right- or left-hand hips (at 45-degree skews), and can be installed before or after the hip and jack. Can also be used for double (terminal) hips.

The LTHJA26 is a lighter-capacity version of the THJA26 and offers the lowest-cost alternative for light hip/jack load applications.

Material: THJA26 — 14 gauge; LTHJA26 — 18 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- All multi-ply members must be fastened together to act as a single unit.
- Shall be attached to a double girder truss to allow for required minimum nail penetration. See footnote 3 for girder truss requirements.
- LTHJA26 only: 0.148" x 1 1/2" nails must be installed into bottom of hip members through bottom of hanger seat for table loads.

Options:

- These hangers cannot be modified

Codes: See p. 13 for Code Reference Key Chart

Web Applications:
Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Wind (160) is a download rating.
3. Loads shown are based on a minimum (2) 2x6 carrying member. For single 2x carrying members (min. 2x6), use 0.148" x 1 1/2" nails and use 0.67 of the table value. For (2) 2x4 carrying members, multiply the download by 0.50.
4. Tabulated hip and jack allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load.
5. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie [Hanger Selector web application](http://app.strongtie.com/hs) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
6. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

MTHMQ/MTHMQ-2

Medium-Duty Multiple-Truss Hangers

The MTHMQ and MTHMQ-2 are designed for carrying two or three trusses. The design offers concealed flanges and installs with Strong-Drive® SDS Heavy-Duty Connector screws (included) for easier installation.

Material: 12 gauge

Finish: Galvanized (G90)

Installation:

- Use all specified fasteners; see General Notes.
- Can be installed filling round holes only, or filling round and triangle holes for maximum load. For all installations, fill the fastener holes in the bottom of the hanger seat.
- For installations at panel points with 2x6 bottom chords, do not fill the triangle holes unless approved by the Truss Designer.

Codes: See p. 13 for Code Reference Key Chart

- Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- A minimum two-ply carrying member is required for the tabulated loads. With single 2x carrying members, use ¼" x 1½" Strong-Drive® SDS Heavy-Duty Connector screws in the carrying member and reduce the load to 0.60 of the table value.
- For installations on 2x6 carrying members not at a panel point, the four uppermost face fasteners are not installed. For installations on 2x6 carrying members at a panel point, fasteners are installed into the round holes only (minimum vertical member sizes are 2x6 and 2x8 for the MTHMQ and MTHMQ-2, respectively).
- Tabulated two-member allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load.
- For terminal hips, divide the total allowable load by 2 to determine the allowable load for each hip.
- Tabulated three-member loads assume that each hip carries 40% of the total load and the jack carries 20% of the total load. Other hip-jack load distributions are allowed if the load sum for all three carried members does not exceed the total load and the hip members are equally loaded.
- Where noted in the table, the total allowable download for the MTHMQ-2-SDS3 (min.) for a three-member connection at the 115/125/160 load duration is 5,400 lb. (DF/SP) and 3,890 lb. (SPF/HF).
- Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2014. Simpson Strong-Tie [Hanger Selector web application](#) includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
- Strong-Drive SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a 5/32" bit maximum).
- Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws.
See pp. 23–24 for fastener information.

HTHMQ

Heavy Multiple-Truss Hanger

The HTHMQ is a versatile, high-capacity truss hanger designed for various lumber types and multiple-ply trusses. The truss hanger accommodates a greater range of structural designs while accommodating right- or left-hand hips (at 30°–60° skews), which can be used for terminal hips with or without the center common jack. The HTHMQ can accommodate various widths of lumber.

Features:

- Available in various stirrup widths to accommodate various lumber types and multiple-ply trusses
- Installed with Strong-Drive® SDS Heavy-Duty Connector screws that eliminate the inconvenience of bolted installation
- Enables 2-3 member connection for a broader range of structural designs

Material: Back plate — 3 gauge; stirrup — 7 gauge

Finish: Simpson Strong-Tie gray paint

Installation:

- Use all specified fasteners; see General Notes.
- Strong-Drive SDS Heavy-Duty Connector screws supplied with connector.
- All **multi-ply** members must be fastened together to act as a single unit.
- Shall be attached to a minimum double girder truss to allow for required minimum screw penetration. See footnote 5.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref ANSI/TPI 1-2014 Section 7.5.3.5).
- See below for different installation options.

Codes: See p. 13 for Code Reference Key Chart

1. Tabulated allowable loads must be selected based on duration of load as permitted by the applicable building code.

2. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

3. Specify W₁ where applicable and Hip Skew Angle.

4. Connector must be installed centered on minimum 2x8 vertical web.

5. A minimum two-ply carrying member is required for the tabulated loads.

6. All multi-ply members must be fastened together to act as a single unit, as determined by the designer.

7. Tabulated allowable loads for three-member configurations assume that each hip carries 40% of the total load and the jack carries 20% of the total load.

Tabulated allowable loads for single hip-jack configurations assume that 75% of the total load is distributed to the hip and 25% to the jack.

8. Strong-Drive® SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a 5/32" bit maximum).

9. 1/4" x 2 1/2" Strong-Drive SDS Heavy-Duty Connector screw (sold separately) may be substituted for the 1/4" x 3" SDS screw provided with the HTHMQ with no load reduction. Back-to-back installations require a three-ply minimum girder.

THGQ/THGQH/HTHGQ

Girder Hangers for SCL or Truss Girders Attached to Truss

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

A lower-cost alternative to bolted hangers, the THGQ and THGQH hangers for multi-ply girder trusses use Strong-Drive® SDS Heavy-Duty Connector screws to provide high load capacities and easier installation compared to bolts. The Strong-Drive SDS Heavy-Duty Connector screws help transfer the load between the plies of the supporting girder when they penetrate all plies.

THGQ and THGQH models offer minimum and optional maximum fastener quantities to accommodate varying design needs. Allowable loads for various girder web member sizes provide additional installation options.

The HTHGQ is a high-load version designed to carry multi-ply trusses up to 5-ply girder trusses. For high-load capacities and easier installation compared to bolts, the HTHGQ is designed for use with Strong-Drive SDS Heavy-Duty Connector screws.

Material: THGQ — 7 gauge; THGQH/HTHGQ — 3 gauge

Finish: THGQ — galvanized;
THGQH/HTHGQ — Simpson Strong-Tie gray paint

Installation:

- Use all specified fasteners. See General Notes.
- Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- Strong-Drive SDS Heavy-Duty Connector screws supplied for all round and triangle holes. Installation may not require use of all Strong-Drive SDS Heavy-Duty Connector screws.
- All **multi-ply** members must be fastened together to act as a single unit.
- The thickness of the supporting girder must be equal to or greater than the screw length. For applications where the length of the supplied screws exceeds the thickness of the supporting girder, 3" or 4½" screws may be substituted for the longer length screws with no load reduction, or a shim block may be used as approved by the designer.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref ANSI/TPI 1-2014 Section 7.5.3.5).

Options:

- See Hanger Options information on pp. 101–103.
- THGQH may be skewed 45° for the models shown. See p. 227.
- For Hem-Fir or Spruce-Pine-Fir members, multiply tabulated allowable loads for the skewed THGQH by 0.86. Connector must be installed centered on girder vertical webs.

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
2. Connector must be installed centered on girder vertical webs.
3. Strong-Drive® SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a $\frac{5}{32}$ " bit maximum).
4. Strong-Drive SDS Heavy-Duty Connector screws that penetrate all plies of the supporting girder (screws must penetrate a minimum of 1" into the last truss ply) may also be used to transfer the load through all the plies of the supporting girder. When SDS Heavy-Duty Connector screws do not penetrate all plies of the supporting girder truss, supplemental SDS screws at the hanger locations may be required to transfer the load to the truss plies not penetrated by the face fasteners, as determined by the designer.
5. The supporting girder truss must have adequate thickness to accommodate the screw length, so that the screw does not protrude out the back of the girder. 3"- or 4 $\frac{1}{2}$ "-long Strong-Drive SDS Heavy-Duty Connector screws may be substituted for longer SDS screws with no load reduction.
6. For installations to LSL, use $\frac{1}{4}$ " x 3" Strong-Drive SDS Heavy-Duty Connector screws and use the DF/SP table loads.
7. Wind (160) is a download rating.

Allowable Loads for Heavy Multi-Ply Truss Girder

1. Tabulated allowable loads must be selected based on duration of load as permitted by the applicable building code.
2. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
3. Wind (160) is a download rating.
4. Connector must be installed centered on a minimum 2x10 vertical web.
5. A minimum three-ply carrying member is required for the tabulated loads.
6. Carrying truss plies must be adequately fastened together as determined by the designer.
7. Strong-Drive SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a $\frac{5}{32}$ " bit maximum).

		2x10	(40) 1/4" x 6"			13,990

1. For Hem-Fir or Spruce-Pine-Fir members, multiply tabulated allowable loads for the skewed THGQH by 0.86. Connector must be installed centered on girder vertical webs.

THGB/THGBH/THGW/THGBV/THGBHV/THGWV

Truss and SCL-to-Truss Girder Hangers

These high-capacity, welded hangers are designed for attaching two-ply, three-ply or four-ply-sized structural composite lumber (SCL) and multi-ply girder trusses to a girder truss.

The THGBV and THGB offer optional installation with Strong-Drive® SDS Heavy-Duty Connector screws, while the bolted THGBHV, THGWV, THGBH and THGW offer higher load capacities.

For the THGBV/THGBHV/THGWV series, two bucket heights are available for each width to accommodate a range of SCL sizes. Options for skewing or dropping the buckets for conditions where the SCL joist is lower than the girder bottom chord provide additional design flexibility for a variety of SCL-to-truss connections.

See the THGQ/THGQH series for a lower-cost alternative that uses Strong-Drive SDS Heavy-Duty Connector screws instead of bolts and offers high-load capacities.

Material: 3 gauge

Finish: Simpson Strong-Tie gray paint

Installation:

- Use all specified fasteners; see General Notes.
- All multi-ply members must be fastened together to act as a single unit.
- Maximum 11 7/8" bottom chord in the carrying member to allow for the minimum bolt end distance.
- Bolts must be installed symmetrically when using fewer than eight bolts on the eight-bolt backplate.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref. ANSI/TPI 1-2014 Section 7.5.3.5).
- Shall be attached to a two-ply girder truss to allow for required minimum screw penetration. See footnote 4.

Options:

Skewed Seat

- THGB/THGBH/THGBV/THGBHV hangers can be skewed to a maximum of 45°. The maximum allowable down load and uplift load for skew is 0.87 of the table load.

Dropped Bucket

- THGBV/THGBHV backplates can be extended to allow for up to a 6" dropped bucket.
- Allowable loads are 100% of the table loads.
- Order as "X" version, specify the total backplate height, BK_PLT, equal to the hanger height (H) plus the dropped bucket amount (d_b). Ex: a THGBV3.62/9 with a 4" dropped bucket would have a total backplate height of 27 1/4".

Codes: See p. 13 for Code Reference Key Chart

- Allowable loads are based on a SCL (LVL, PSL, or LSL) carried member with an allowable $F'_{c\perp}$ of 750 psi and equivalent Specific Gravity of 0.50 or higher.
- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- A three-ply carrying member is required for the THGWV5.50/9 and THGWV5.50/11; a four-ply carrying member is required for the THGWV7.25/9 and THGWV7.25/11.
- Strong-Drive® SDS Heavy-Duty Connector screws require a minimum two-ply (3") carrying member.
- Bolts and Strong-Drive SDS Heavy-Duty Connector screws (not included) may be installed through metal truss connector plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met.
- Wind (160) is a download rating.
- To achieve published loads, install bolts into the girder truss with the nut on the opposite side of the hanger with a standard-cut washer (except THGWVs). Standard-cut washers are required for THGBV and THGBHV.
- Fasteners:** Nail dimensions are listed diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- A three-ply carrying member is required for the THGW3-3 and THGW4-3; a four-ply carrying member is required for the THGW3-4 and THGW4-4. For all other models, a minimum two-ply carrying member is required.
- Strong Drive® SDS Heavy-Duty Connector screws require a minimum two-ply (3") carrying member.
- Bolts and Strong Drive SDS Heavy-Duty Connector screws (not included) may be installed through metal truss connector plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met.
- (10) 0.148" x 3" nails for the carried member will achieve the maximum downloads. Uplift loads are 2,570 lb. for DF/SP and 2,210 lb. for SPF/HF. To achieve maximum uplift, install nails and bolts listed in the table.
- Loads for THGW models require that the supported member have minimum 2x6 end verticals to ensure end-grain bearing. Contact Simpson Strong-Tie for loads when horizontal members are bearing in the hanger seat.
- Wind (160) is a download rating.
- To achieve published loads, install bolts into the girder truss with the nut on the opposite side of the hanger with a standard-cut washer (except THGWs). Standard-cut washers are required for THGB and THGBH.
- Fasteners:** Nail dimensions are listed diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Alternative Installations

- Block(s) should be of similar size/grade as the truss member to which it is attached. Blocking should be designed to act as one unit with the truss members.
- Block(s) should be of sufficient size to accept all carried/carrying member nails, and develop full seat bearing as specified in Simpson Strong-Tie publications.
- Truss Designer is to confirm blocking size/grade, fasteners required and application.
- Fasteners used to attach the additional blocking should be independent of the truss hanger fasteners.

Use of wood blocking to achieve the full design load value of a face-mount hanger attached to a single-ply carrying (girder) member. (Block designed by Engineer of Record or Truss Designer.)

Example shown: HGUS28-2
installed on a 2x6 bottom chord
(other applications similar)

Connection design to achieve specified nailing of a face-mount hanger at a panel point. Nails located in joints formed by the intersection of wood members or with edge or end distances less than suggested by NDS have no load resistance. The hanger allowable load value shall be reduced by the nail shear value for each header nail less than the specified quantity. Connection shall be approved by the Truss Designer.

Example shown:
THGBH4 installed

Use of wood filler blocking for carried member width less than hanger width. (Block designed by designer or Truss Designer.)

DSC

Drag Strut Connector

The DSC drag-strut connector transfers diaphragm shear forces from a girder truss or beam to shearwalls. The DSC5 has been designed to optimize fastener location. The DSC2 is a smaller, lighter version that installs with fewer fasteners.

Features:

- Left hand and right hand versions available
- DSC connectors install with the 1/4" x 3" Strong-Drive® SDS Heavy-Duty Connector screws (provided)

Material: DSC2 — 8 gauge; DSC5 — 3 gauge

Finish: DSC2 — galvanized;
DSC5 — Simpson Strong-Tie gray paint

Installation:

- Use all specified fasteners; see General Notes
- Strong-Drive SDS Heavy-Duty Connector screws are provided

Codes: See p. 13 for Code Reference Key Chart

Model No.	L	SDS Fasteners	DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
			Compression (160)	Tension (160)	Compression (160)	Tension (160)	
DSC2R/L-SDS3	16	(20) 1/4" x 3"	2,590	3,575	2,490	3,100	IBC®, FL
DSC5R/L-SDS3	21	(24) 1/4" x 3"	4,460	4,335	3,830	3,715	

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Strong-Drive SDS Heavy-Duty Connector screw minimum penetration is 2 3/4", minimum end distance is 2 1/2" for DSC2 and 3 3/4" for DSC5, and minimum edge distance is 5/8" for full load values.
3. Strong-Drive SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a 5/8" bit maximum).
4. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Typical DSC5R-SDS3 Installation
(DSC2 similar)

AHEP

Adjustable Hip-End Purlin

The AHEP is a structural purlin that also serves as an installation lateral restraint and spacer during the truss erection process. The AHEP attaches to the leading edge of step-down hip trusses, eliminating the need for drop-top chords, 2x lumber or gable end fillers. The interlocking design of the AHEP allows them to install linearly, aligned with the end jacks, to maintain framing spacing from eave to hip or peak. Roof sheathing/decking attaches directly to the purlin with knurled pneumatic fasteners or low-profile head, self-drilling screws. Adjustable in length, the AHEP is designed to accommodate a pitch range of 3/12 to 9/12 as a structural purlin and up to 12/12 as an installation lateral restraint and spacer.

Features:

- A structural purlin to which sheathing can be directly attached — no need to remove temporary bracing
- Accurately spaces the installed trusses and helps meet the temporary top-chord lateral restraint recommendations of WTCA/TPI BCSI on step-down hip ends
- Adjustable in length to accommodate a wide pitch range

Material: 20 gauge (33 mil)

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Prior to installation, the AHEP must be set to the proper length and the two tubes fastened together with four #10 x 3/4" self-drilling screws through the round holes in the side flanges for pitches between 3/12 and 9/12; and in the triangular and upper round hole when the AHEP will be used as an installation restraint and spacer at pitches 9/12 up to 12/12.
- For trusses spaced 24" o.c., the pitch markings on the inner tube may be used to line up the tubes to the correct length for a given pitch. For other spacings, the length of the AHEP must be set to the calculated sloping length (from leading edge to leading edge of the framing members).
- To install the AHEPs on wood trusses, use four 0.148" x 3" nails. The two nails at the bottom of the part (the yoke end) must be clinched.
- Sheathing is attached to the AHEP with knurled pneumatic fasteners or low-profile-head, self-drilling screws.
- For efficiency, the AHEPs should be installed in line with the end jacks so that framing alignment can be maintained from eave to hip/ridge.

Codes: See p. 13 for Code Reference Key Chart

The two nails at the bottom of the part (the yoke end) must be clinched.

	AHEP Side Flanges	To Hip Trusses		3/12 Pitch		3.1/12 Pitch		9/12 Pitch		
				L/180	3/16"	L/180	3/16"	L/180	3/16"	
AHEP	(4) #10 x 3/4	(4) 0.148 x 3	None	180	240	180	240	135	150	IBC®, FL
			1 5/32" (min.) wood sheathing	250	345	210	275	160	175	

1. Loads may not be increased for duration of load.
2. Allowable loads apply to wood with a specific gravity of 0.42 or greater.
3. Designer shall ensure that attached members are adequately designed to resist applied loads.
4. Straight-line interpolation can be used to determine allowable loads for pitches between 3.1:12 and 9:12.
5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

TSF

Truss Spacer

The TSF is a fast and accurate method for spacing trusses that eliminates layout marking of top plates and can be left in place under the sheathing. Accuracy is improved, spacing errors are minimized, and it is easy to use.

Material: 22 gauge

Finish: Galvanized

Installation:

- See installation sequence below.
- TSF truss **spacers** do not provide bracing of any kind and are not structural members. The TSF is for spacing only. Refer to instructions from architect, engineer, truss manufacturer or other for bracing and installation information.

Codes: See p. 13 for Code Reference Key Chart

TSF

Model No.	Dimensions			Code Ref.
	W	O.C. Spacing	Total Length	
TSF2-16	1 ½"	16"	8'	—
TSF2-24	1 ½"	24"	10'	

Step 1
Nail starting notch to first member.

Step 2
As each successive member is positioned, unfold TSF to next notch. The notch teeth grip member and align it for nailing.

Step 3
If spacer does not align with end truss, break spacer off at notch. Then, hammer spacer flat, fold it under and nail.

TSBR

Truss Spacer-Restraint

The Simpson Strong-Tie TSBR truss spacer-restraint is a time-saving lateral-restraint product that improves quality and safety while helping to meet the prescriptive recommendations of the WTCA/TPI. Easier to install than wood bracing, the TSBR firmly grips the trusses, capturing on-center spacing and keeping them vertical and plumb after placement, resulting in a better truss installation. The unique design eliminates additional time spent measuring truss spacing and laying out temporary lateral bracing. And once installed, the TSBR can remain in place to be sheathed over, thereby eliminating the need to remove temporary bracing and creating a safer, more stable work platform.

Features:

- Enables the quick and accurate spacing of trusses without measuring or adjusting
- Helps meet prescriptive temporary bracing recommendations of the BCSI
- Easily “grabs” onto the truss — may be put in place with one hand
- Stays in place during sheathing, saving time and making the roof more stable for workers
- Installs in less time and requires less total bracing material than prescriptive wood bracing methods — reducing labor costs
- The TSBR is a direct replacement for the TSB truss spacer bracer

Material: 22 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- TSBR lateral restraint locations are as recommended in Table B2-1 of SBCA/TPI BCSI or the BCSI B2 Summary Sheet. For more information, see strongtie.com.

Codes: See p. 13 for Code Reference Key Chart

TSBR may be replaced at ridge by wood blocking as required for diaphragm nailing

**Typical TSBR2-24
Installation on 2x Wood Truss**

Model No.	Dimensions (in.)			Fasteners (Total) (in.)	Allowable Loads (lb.)				Code Ref.
	L	W	D		DF/SP		SPF/HF		
					Compression	Tension	Compression	Tension	
TSBR2-16 (Min.)	17½	1¼	1¼	(2) 0.148 x 3	540	180	465	155	—
TSBR2-16 (Max.)	17½	1¼	1¼	(4) 0.148 x 1 ½	540	465	465	400	
TSBR2-24 (Min.)	25½	1¾	1	(2) 0.148 x 3	500	180	430	155	IBC®, FL
TSBR2-24 (Max.)	25½	1¾	1	(4) 0.148 x 1 ½	500	465	430	400	

1. Loads may not be increased for duration of load.
2. Minimum nailing meets or exceeds the temporary lateral-restraint recommendations of SBCA/TPI BCSI.
3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

TBE

Truss Bearing Enhancer

The TBE transfers load from the truss or girder to plates for bearing-limited conditions and provides exceptional uplift capacity. It replaces nail-on scabs that provide lower load transfer, or in some cases, an additional ply when needed for bearing. One size works with any number of girder plies.

The table lists allowable loads for TBE4 used on 2x4 and TBE6 used on 2x6 top plates. The table gives the different loads calculated for TBE with and without wood bearing. See Fastener Schedule and Alternative Installation below.

Material: 18 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- TBE must be installed in pairs.
- Top-plate size is 2x4 for TBE4, 2x6 for TBE6. Use alternate installation for TBE4 and TBE6 on larger plates or presheathed walls. See alternate installation below.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

Two TBE Installed with Two-Ply Girder Truss

Two TBE Installed with Single-Ply Truss

TBE Fastener Schedule

Model No.	Truss Plies	Fasteners per each TBE (in.)	
		Rafter	Plate

1. Loads are for a pair of TBEs.

2. When truss chord wood species is different from the wall top-plate wood species, choose the tabulated allowable loads based on the species with the lower tabulated download capacity.

3. Uplift and lateral loads have been increased for wind or earthquake loading, with no further increase allowed; reduce where other loads govern.

4. Allowable loads are determined only by nail shear calculations or tests of the metal connectors based on the lowest of 0.125" of deflection or the ultimate load with a safety factor of 3. The attached wood members must be designed to withstand the loads imposed by the nails.

5. Perpendicular-to-Plate loads are reduced for Alternative Installation.

6. Parallel-to-Plate loads are not reduced for Alternative Installation.

7. The width of bearing wall required to provide the same bearing capacity as the TBE Allowable Load (TBE and Wood Top Plate) is referred to as the Equivalent Bearing Length.

TC

Scissor Truss Connector

The TC truss connector is an ideal connector for scissor trusses and can allow horizontal movement up to 1¼". The TC also attaches plated trusses to top plates or sill plates to resist uplift forces. Typically used on one or both ends of truss as determined by the designer.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Drive 0.148" x 3" nails into the truss at the inside end of the slotted holes (inside end is towards the center of the truss and clinch on back side). Do not seat these nails into the truss — allow room under the nail head for movement of the truss with respect to the wall.
- After installation of roofing materials nails may be required to be fully seated into the truss. (As required by the designer or Truss Designer.)

Optional TC Installation:

- Bend one flange up 90°. Drive specified nails into the top and face of the top plates or install Titen Turbo™ screws into the top and face of masonry wall. See optional load tables and installation details.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

Typical TC24 Installation

Optional TC26 Installation for Grouted Concrete Block using a Wood Nailer (8", 10", 12" wall installation similar)

Optional TC26 Installation for Grouted Concrete Block using Titen Screws

Model No.	Fasteners (in.)		DF/SP Allowable Loads	SPF/HF Allowable Loads	Code Ref.
	Truss	Plate	Uplift (160)	Uplift (160)	
TC24	(4) 0.148 x 3	(4) 0.148 x 3	350	300	IBC®, FL
TC26	(5) 0.148 x 3	(6) 0.148 x 3	575	495	
TC28	(5) 0.148 x 3	(6) 0.148 x 3	575	495	

See footnotes below.

Optional TC Installation Table

Model No.	Fasteners (in.)		DF/SP Allowable Loads	SPF/HF Allowable Loads	GFCMU Allowable Loads	Code Ref.
	Truss	Plate	Uplift (160)	Uplift (160)	Uplift (160)	
TC26	(5) 0.148 x 1 ½	(6) 0.148 x 1 ½	370	300	—	IBC, FL
	(5) 0.148 x 3	(6) 0.148 x 3	385	335	—	
	(5) 0.148 x 3	(6) 3/16 x 2 ¼ Titen Turbo	—	—	170	

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. Grout strength is 2,000 psi minimum.
3. Nail values based on single 2x truss. 0.148" x 3" joist nails must be clinched.
4. Optional TC26 installation with 0.148" x 3" nails requires minimum 3" top-plate thickness.
5. **Fasteners:** Nail dimensions are listed diameter by length. Titen Turbo screws are Simpson Strong-Tie concrete and masonry screws. See pp. 23–24 for fastener information.

HTC

Heavy Truss Clip

For alignment control between a roof truss and nonbearing walls; the 2½" slot permits vertical truss chord movement when loads are applied.

Material: 18 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- The HTC has a 2½" slot to accommodate truss movement
- This connector has high lateral capacity
- The S/HTC is available for steel truss applications
- Products not intended for floor applications due to the frequency of floor joist deflections and potential for squeaks

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

Model No.	Dimensions	Fasteners (in.)		Allowable Loads ¹ (160)				Code Ref.
	Top Plate	Base	Slot	Without Gap ²		With 1 1/4" Gap ³		
				F ₁	F ₂	F ₁	F ₂	
HTC4	2x4 plate	(6) 0.148 x 3	(3) 0.148 x 3	370	305	85	255	IBC®, FL, LA
	2x6 plate	(6) 0.148 x 3	(3) 0.148 x 3	410	265	155	250	

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.

2. Truss or rafter must bear on top plate to achieve the allowable loads under "Without Gap."

3. When installed with maximum 1¼" space between rafter or truss and top plate, use loads under "With 1¼" Gap." Where loads are not required, space is not limited to 1¼".

4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical HTC4 Installation
on a 2x4 Plate

Typical HTC4 Installation
on a 2x6 or Larger Plate

STC/STCT/DTC

Roof Truss Clips

For alignment control between a roof truss and nonbearing walls; the 1½" slot permits vertical truss chord movement when loads are applied.

Material: 18 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Use STC or DTC depending on required loads. STC, installed with DS drywall stop, helps prevent fasteners tearing through the ceiling drywall (see illustration).
- Use STCT where truss or rafter is separated from the top plate of the nonbearing wall.
- Install slot nails in the middle of the slot.
- Products not intended for floor applications due to the frequency of floor joist deflections and potential for squeaks.

Options:

- For alternative solutions, see SDPW on p. 353.

Codes: See p. 13 for Code Reference Key Chart

Model No.	Fasteners (in.)		Allowable Loads (160)						Code Ref.
	Base	Slot	Without Gap		¼" Max. Gap		¼" < Gap ≤ ½"		
			F ₁	F ₂	F ₁	F ₂	F ₁	F ₂	
STC	(2) 0.131 x 2½	(1) 0.131 x 2½	70	55	35	30	25	40	IBC®, FL, LA
STCT	(2) 0.131 x 2½	(1) 0.131 x 2½	70	55	35	30	25	40	
DTC	(4) 0.131 x 2½	(2) 0.131 x 2½	125	200	80	125	55	70	

1. Loads may not be increased for duration of load.
2. Truss or rafter must bear on top plate to achieve the allowable loads under "Without Gap."
3. Clips are required on both sides of the truss to achieve F₁ loads in both directions (stagger parts to avoid nail interferences).
4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Nails should not be driven completely flush against the connector, to allow vertical truss movement.

Allow ⅛" gap between nail head and truss clip to help prevent squeaking.

Typical STC Installation with DS
(see p. 326 for Drywall Stop)

Typical Strong-Drive® SDPW Deflector Screw Installation
(see p. 353 for more information)

GBC

Gable Brace Connector

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The GBC provides a proven, tested connection for the anchorage of building stability bracing to the top of the gable end wall. With allowable bracing installation angles between 40° to 60°, the GBC offers greater flexibility in a connector rated for both tension and compression loads.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- The GBC must be installed in pairs to achieve full load capacity

Codes: See p. 13 for Code Reference Key Chart

US Patent 7,788,873

Model No.	Qty. Required	Fasteners per Connector (in.)		DF/SP Allowable Loads (160) Perpendicular to Endwall (F ₂)				SPF/HF Allowable Loads (160) Perpendicular to Endwall (F ₂)				Code Ref.
				Toward GBC		Away from GBC		Toward GBC		Away from GBC		
		Gable Brace	Top Plates	Gable Brace Angle		Gable Brace Angle		Gable Brace Angle		Gable Brace Angle		
				40°–45°	46°–60°	40°–45°	46°–60°	40°–45°	46°–60°	40°–45°	46°–60°	
GBC	2	(5) 0.131 x 1½	(7) 0.131 x 2½	650	825	400	305	545	695	335	255	IBC®, FL

1. For 1¼" x 3½" (or larger) LVL gable brace, the allowable load at 40° to 45° is 635 lb. towards anchors, 515 lb. away from anchors.
2. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
3. Use a minimum 2x4 gable brace. Larger members may be used.
4. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23-24 for fastener information.

Typical GBC Installation

Typical Sloped Installation

GBC

Gable Brace Connector (cont.)

GBC Installation Sequence

Slope	H Dimension
40°	2 ¹⁵ / ₁₆ "
50°	3 ¹ / ₁₆ "
60°	3 ⁹ / ₁₆ "

Step 1

Double angle cut the gable brace to sit flat on the wall double top plate and flush against the gable end truss for 2x4 top plate. The double angle cuts should form a 90° angle on the end of the gable brace.

Step 2

Set each GBC on top of the double top plate so that the bend line slots are flush with the inside edge of the double top plate. Install fasteners into the top of the double top plate.

Step 3

Bend GBC legs (one time only) over the inside of the double top plate and install fasteners.

Step 4

Install fasteners into the gable brace.

Note: Attach the other end of the gable brace to blocking at the roof diaphragm as directed by the designer.

CHC

Component Hoist Clip

The CHC component hoist clip provides a tested, load-rated solution for the safe lifting and placement of assembled wood components. The CHC is load-rated with Strong-Drive® SDS Heavy-Duty Connector screws for easy installation and removal, and superior shear and withdrawal strength during lifting.

Features:

- Attaches easily to wood members using Strong-Drive SDS Heavy-Duty Connector screws (sold separately)
- May be used alone or in pairs for increased load
- Tested in multiple load directions for versatility

Material: 12 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- Fasteners require full penetration into the framing members
- Use one time only
- Lifting devices should be connected to the CHC with a closed-loop attachment of sufficient strength to carry the allowable load

Codes: See p. 13 for Code Reference Key Chart

CHC
US Patent 8,720,129

CHC with Tension Load Applied

Allowable Loads

Model No.	Qty.	Type of Connection	SDS Fasteners per Part		Angle from Horizontal, θ	Line Angle, α	Allowable Tension DF/SP/SPF/HF (125)	Code Ref.
			Top	Face				
CHC	1	1	(2) 1/4" x 3"	(3) 1/4" x 3"	0-44	—	610	—
	1	1			45-90	—	975	
	2	1			30	120	610	
	2	1			45	90	1,380	
	2	1			60	60	1,690	
	2	2			90	—	1,950	

1. Allowable loads are based on the lowest ultimate test load of three test specimens, or the average of six specimens, divided by five.
2. Loads may not be increased for duration of load.
3. Allowable loads are based on installation over sheathing on stud walls with double 2x top plates and maximum 5/8" sheathing.
4. Fasteners require full penetration into the framing members.
5. All lifting devices and spreader bars that are used in conjunction with the CHC shall be of sufficient strength to carry the required load. Spreader bars must also have sufficient rigidity to resist bending of the lifted component.

Typical CHC Installation Using Two Parts

1 Typical CHC Installation with Angular Loading

2 Typical CHC Installation with Spreader Bar

DGT™/DGHT™

Fire Wall Hangers

Ideal for multi-family, multi-level Type III residential construction, the new patent-pending DGT and DGHT hangers are load-tested firewall hangers with a two-hour fire rating. They're the first fire wall hangers designed to install with a power nailer during framing, which helps save time before hanging drywall and keeps construction projects on schedule.

These two top-flange hangers connect floor trusses and joists to wood stud walls. Both models are offered in a wide range of sizes, making them simple to select and use. Both the DGT and DGHT hangers feature space for two layers of $\frac{5}{8}$ " gypsum board (drywall) to be slipped into place after the framing is complete.

These fire wall hangers have been tested according to ASTM E814 and received a two-hour fire rating for use on one or both sides of the wall. This rating verifies that the DGT and DGHT hangers do not reduce the two-hour fire wall assembly rating.

Features:

- Tested loads for 1½" and 2½" power-driven or hand-installed nails.
- Optimized, cost-effective design for the market.
- Tested and code-listed for for 2x4 walls.
- Innovative top-flange design for back-to-back installation on 2x6 (min.) walls.
- Two-hour Fire-Resistant rating Intertek Design No. SST/WPCF 120-01.

Intertek

Material: DGT — 12 gauge; DGHT — 10 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners. I-joists require web stiffeners.
- DGT/DGHT hangers are mounted like a standard top-flange hanger.
- Stud wall-plate splices must occur at a stud location.
- DGT welded to steel header with (4) $\frac{1}{8}$ " x 1½" fillet welds and (6) joist nails achieves a download of 1,700 lb. Face flanges require full backing.
- DGHT welded to steel header with (4) $\frac{3}{16}$ " x 1½" fillet welds and (6) joist nails achieves a download of 2,700 lb. Face flanges require full backing.

Options:

- All DGHT models may be ordered with a skew angle of up to 45° or with one flange concealed left or right. To order, add an "X" to the model number.
- For the skew option, specify skew direction and angle (e.g., for a 3½" x 18" joist skewed 45° to the right, order as DGHT3.62 /18X SKR45).
- For the concealed-flange option, simply specify left or right (e.g., DGHT3.62 /18X right flange concealed). Concealed option available for widths from 3½"–7½".

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

Two-Hour, Fire-Rated Wall

Simpson Strong-Tie has completed ASTM E814 standard testing at an accredited laboratory. The use of the DGT/DGHT hangers does not reduce the two-hour, fire wall assembly rating.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Allowable loads are for 2x4 minimum stud wall or nailer. Back-to-back installations require a minimum 2x6. Wall design by designer.
- Hangers spaced closer than 16" o.c. shall reduce allowable load proportionately (e.g. for hangers spaced at 12" o.c., adjust tabulated loads by $\frac{12}{16} = 0.75$).
- Where "(over studs)" is listed, DGHT installation requires a minimum (2) 2x4 stud or post in the wall at hanger location. Post design by designer. Where "(over studs with SDWC)" is listed, install SDWC15600 per the figure on p. 247.
- DGHT hangers may be skewed up to 45°. Skew and concealed flange options cannot be combined. For skewed DGHT, apply 0.78 factor on hanger widths of 1 1/8"–3 3/8" and 0.57 factor on widths of 3 1/4"–7 1/4" for uplift and download. Square cut or bevel cut joist allowed. For DGHT one face flange concealed, use 0.74 of the table loads for uplift and download.
- Web stiffeners required for I-joists.
- DGT and DGHT may be installed over 5/8" maximum wood structural sheathing. For DGT, use 0.72 of the table loads for uplift and download. For DGHT, use 0.75 of table loads for uplift and download. Sheathing shall be installed flush with top of wall and fastened per code.
- Fasteners:** Nail dimensions are listed diameter by length. SDWC15600 = 0.152" shank diameter x 6" long Strong-Drive® SDWC Truss Screw. See pp. 23–24 for fastener information.

DU™/DHU™/DHUTF

Fire Wall Hangers

The DU/DHU face-mount and the DHUTF top-mount hangers are designed to carry joist floor loads to a wood stud wall through two layers of 5/8" gypsum board (drywall). These hangers install after the drywall is in place. The hangers come in sizes that accommodate most joists used in multi-family construction including I-joists and trusses.

All three fire wall hangers are fire-resistant F (flame) and T (temperature) rated in Intertek Design No. SST/WPCF 120-01.

Material: DU — 14 gauge;
DHU and DHUTF — 12 gauge

Finish: Galvanized

Installation: • Use all specified fasteners; see General Notes.

- Strong-Drive® SDS Heavy-Duty Connector screws are provided with the hanger.
- Drywall is installed first.
- DU and DHU are mounted with top of hanger flush with top of wall and tight to the drywall.
- Wall top plates must be restrained to prevent rotation. Where gravity load on top of wall is less than 150 plf, use a stud plate tie connector at the back of each stud or provide equivalent restraint by another method as determined by designer.
- Stud wall top plate splices must occur at a stud location.

Options: • The DHU may be ordered with one flange concealed for widths at least 2 1/2" wide; specify which flange when ordering. Use 74% of the table downloads and 100% of table uplift loads.

- The DHU/DHUTF may be ordered skewed up to 45°. Use 75% of the table downloads and 50% of table uplift loads.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

Two-Hour, Fire-Rated Wall

Simpson Strong-Tie has completed ASTM E814 standard testing at an accredited laboratory. The use of the DU/DHU/DHUTF hangers does not reduce the two-hour, fire wall assembly rating. The hangers tested provide an F (flame) and T (temperature) rating.

Typical Installation Showing DHU with Concealed Flange Option (at left) and a DHU Standard Installation

Allowable Loads

Model	Condition ¹	DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
		Uplift (160) ^{3,4}	Down (100) ²	Uplift (160) ³	Down (100) ²	
DU	Over (2) layers 5/8" drywall	95	1,110	170	880	IBC, FL, LA
DHU DHUTF	Over (2) layers 5/8" drywall	95	1,410	170	1,185	

1. Loads assume 5/8" Type X drywall attached per IBC. Wall assembly must consist at a minimum of two 2x4 plate members with studs spaced not more than 16" o.c. For alternative solutions to mounting over a single layer of drywall, refer to the technical bulletin T-C-TFWALL at strongtie.com.
2. Hangers spaced closer than 16" o.c. shall reduce allowable load proportionately.
3. Triangular nail holes may be filled with (4) additional 0.148" x 1 1/2" to achieve an allowable uplift load of 750 lb.
4. DF carried members with a minimum of 1 1/2" x 2 1/2" solid sawn chord dimensions may increase Allowable Uplift Load to 170 lb.
5. Allowable downloads may be increased to 1,885 lb. for DF/SP and 1,585 lb. for SPF/HF using the DHU3.56/24 or DHUTF3.56/24 models.
6. For a DHU/DHUTF two-sided (back-to-back) application on a 2x6 wall, use 1,200 lb. allowable download for DF/SP plates and use 1,005 lb. for SPF/HF plates.
7. For a DU two-sided (back-to-back) application on a 2x6 wall, use 1,075 lb. allowable download for DF/SP plates and 880 lb. for SPF/HF plates.
8. For installations of two layers of gypsum wall board over 5/8" maximum wood structural panel, the DHU/DHUTF has an allowable download of 1,975 lb. for DF/SP plates and 1,660 lb. for SPF/HF plates.
9. For the DU, if a 5/8" structural wood panel is used between the drywall and the studs, use 1,110 lb. allowable download for DF/SP plates and 880 lb. for SPF/HF plates.

WMU

GFCMU Top-Flange Hanger

The WMU is designed for use on standard 8"-grout-filled masonry block wall construction (GFCMU).

Material: 12-gauge top flange and stirrup

Finish: Simpson Strong-Tie gray paint; hot-dip galvanized available, specify HDG

Installation:

- Use all specified fasteners; see General Notes.
- Minimum f'_m is 1,500 psi.
- End vertical must be minimum double 2x.
- **Mid-Wall Installation:**
Installed between blocks with two 0.162" x 3½" duplex nails cast into grout with a minimum of one grouted course above and below the top flange and one #5 vertical rebar minimum 24" long in each adjacent cell.
- **Top-of-Wall Installation:**
For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load. Refer to technical bulletin T-C-SLOPEJST at strongtie.com for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes (¾:12).

Options:

- WMU may be sloped upward or downward up to 45°. The allowable download is 0.60 of the table load. There is no reduction for uplift.
- WMU may be skewed up to 45°. The allowable download is 0.60 of the table load. The allowable uplift is 0.25 of the table load.
- WMU may have the top flange offset left or right for placement in corners.
The allowable download is 0.50 of the table load.
The allowable uplift is 0.40 of the table load.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.

3. Top-of-wall installation is also applicable to 6" minimum concrete walls with a minimum compressive strength of $f'_c = 2,500$ psi.

4. See figures for top-of-wall and mid-wall installation.

5. Products shall be installed such that Titen Turbo screws are not exposed to exterior environments.

6. **Fasteners:** Nail dimensions are listed diameter by length. Titen Turbo screws are Simpson Strong-Tie concrete and masonry screws (hex-head model required). See pp. 23–24 for fastener information.

GH

Girder Top-Flange Hanger

A girder-to-foundation wall connection.

Material: 12 gauge

Finish: Simpson Strong-Tie gray paint; hot-dip galvanized, specify HDG

Installation:

- Use all specified fasteners; see General Notes.
- **Install** four 0.162" x 3 1/2" nails into girder.
- H = girder height – mudsill thickness. Measurement is from the bottom of the top flange to the top of the seat.
- 1 1/2" clearance hole accommodates rebar or anchor. This is not required.

Options:

- GH hangers may be skewed to a maximum of 45°; bevel cut required. The allowable loads are 100% of the table load.
- Specify GHD for saddle-style hangers. GHD may not be skewed.

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

1. Loads may not be increased for duration of load.
2. A mudsill on top of the GH is required to achieve the table loads.
3. Models listed are for a 2x plate; specify "H" dimension when ordering for use with a 3x plate.
4. Uplift loads do not apply for this connector.
5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical GH Installation
Skewed Right

HU/HUC

Heavy-Duty Face-Mount Hangers

HU/HUC hangers may be installed on a masonry/concrete wall as described below. Additionally, HU hangers with one flange concealed may be installed similarly.

HU and HUC products are heavy-duty face-mount joist hangers made from 14-gauge galvanized steel.

- The HUC is a concealed flange (face flanges turned in) version of the HU.
- HU is available with both flanges concealed, provided the W dimension is $2\frac{5}{16}$ " or greater, at 100% of the table load. Specify HUC.
- HU is available with one flange concealed when the W dimension is less than $2\frac{5}{16}$ " at 100% of the table load. Specify as an 'X' version and specify flange to conceal.
- For any wood-to-wood HU or HUC shown in this catalog, the user may substitute all face nails with $\frac{1}{4}$ " x $1\frac{3}{4}$ " Titen Turbo™ screws (Model TNT25134H) for concrete and $\frac{1}{4}$ " x $2\frac{1}{4}$ " Titen Turbo screws (Model TNT25214H) for GFCMU. Follow all installation instructions below and use the loads from the sawn lumber or EWP sections.

Material: 14 gauge

Finish: Galvanized; ZMAX® coating available

Installation:

- Attach the hangers to concrete or GFCMU walls using hex-head Titen Turbo screws. Titen Turbo screw anchors for GFCMU ($\frac{1}{4}$ " x $2\frac{1}{4}$ " — Model TNT25214H) and for concrete ($\frac{1}{4}$ " x $1\frac{3}{4}$ " — Model TNT25134H) are sold separately.
- Drill and prep the holes according to the Installation Instructions provided with the packaging for Titen Turbo screw anchors.
- Caution: Oversized-diameter holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.
- Titen Turbo Installation Kits are available (Model TNTINSTALLKIT). A $\frac{3}{16}$ " x 6" SDS-plus drill bit is also available (Model MDPL01860SH).
- **Installation on GFCMU** — A minimum edge distance of $1\frac{1}{2}$ " and a minimum end distance of $3\frac{7}{8}$ " is required as shown in Figure 1 for full load. Where no uplift is required, a minimum end distance of $1\frac{1}{2}$ " is permitted. For HU models installed with $\frac{5}{8}$ " minimum face fastener edge distances or HUC models installed with side of hanger edge flush and with a minimum end distance of 1", allowable download is 0.63 of table loads with no reduction for uplift loads.
- **Installation on Concrete** — A minimum end and edge distance of 3" is required for table loads. For edge distances of $1\frac{3}{4}$ " minimum and a minimum end distance of 3", allowable download is 0.90 of table loads with no reduction for uplift loads. For HU models installed with $\frac{5}{8}$ " minimum face fastener edge distances or HUC models installed with side of hanger edge flush and with a minimum end distance of 1", allowable download is 0.63 of table loads with no reduction for uplift loads.

Codes: See p. 13 for Code Reference Key Chart

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed.

Reduce where other loads govern.

2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.

3. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.

4. When only one flange is concealed, specify whether the right or the left is the concealed flange.

5. Products shall be installed such that Titen Turbo screws are not exposed to the weather.

6. **Fasteners:** Nail dimensions are listed diameter by length. Titen Turbo screws are Simpson Strong-Tie concrete and masonry screws (hex-head model required). See pp. 23–24 for fastener information.

Visit app.strongtie.com/hs to access our Hanger Selector web application.

LGUM/HGUM

Heavy-Duty Face-Mount Beam/Girder Hangers for Concrete and GFCMU

High-capacity beam or girder hangers for concrete or masonry applications. Installation is made easier using Strong-Drive® SDS Heavy-Duty Connector screws (provided) into the wood member and Titen HD® anchors (provided) into the masonry.

Material: See table

Finish: Galvanized; *available in stainless steel*

Installation:

- Use all specified fasteners (included). *Stainless steel models are packaged with 1" longer Type 316 stainless-steel Titen HD anchors.*
- Attach hanger to a concrete or grout-filled CMU wall using Titen HD anchors. Note the following:
 - Drill holes using drill bits equal in diameter to the specified Titen HD anchor.
 - Holes shall be drilled $\frac{1}{2}$ " deeper than the specified Titen HD length (i.e. $4\frac{1}{2}$ " for a 4" long Titen HD anchor). *For stainless-steel LGUM models installed onto 6"-thick concrete or GFCMU, care should be taken to avoid damage to the back side of the wall when drilling and installing 5" long stainless-steel Titen HD anchors.*
 - Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.
- Carbon-steel Titen HD is not recommended for exposed exterior applications.
- Provide moisture barrier between beam and wall per jurisdictional requirements.

Options:

- For HGUM only — other seat widths and hanger heights available. Order as "X" version.
- HGUM available with one flange concealed. See p. 258 for reduced load at end of wall and outside corner.
- LGUM/HGUM available in skews up to 45° . See Hanger Options, p. 258.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Tabulated uplift loads are based on 4" minimum distance to top of wall. For HGUM installations with 15" minimum distance to top of wall, uplift loads are 6,180 lb. for GFCMU and 6,585 for concrete.
- Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
- Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
- LGUM must be installed on minimum 6"-thick wall and HGUM on minimum 8"-thick wall. (Nominal values for GFCMU.)
- Titen HD® anchors may be installed into the head or bed joints.
- SDS screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a ⁵/₃₂" bit maximum).
- For stainless-steel LGUM and HGUM models, use ³/₈" x 5" and ⁵/₈" x 6" Type 316 stainless-steel Titen HD anchors, respectively, to achieve tabulated loads.
- Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive® SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

1. For stainless-steel LGUM and HGUM models, use ⅝" x 5" and ⅝" x 6" Type 316 stainless-steel Titen HD anchors, respectively, to achieve tabulated loads.

MBHA

Concrete and Masonry Top-Flange Hanger

The MBHA is a single-piece, non-welded connector available for solid sawn, truss and engineered wood products.

Material: 10 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes

Options:

- Seat can be skewed at 45° only. The maximum allowable download is 3,495 lb. and 1,585 lb. uplift for height 7¼". For all other models, use the table listed download and uplift of 2,390 lb. Order MBHAR for skew right and MBHAL for skew left.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/hs to access our Hanger Selector web application.

1. ATR is all-thread rod, grade A307 or better.
2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
3. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
4. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
5. Loads are based on installation using SET-3G™, AT-3G™ or ET-3G™ adhesive with 6¼" minimum embedment required. Refer to the Simpson Strong-Tie Anchoring, Fastening, Restoration and Strengthening Systems for Concrete and Masonry catalog at strongtie.com.
6. MBHA hangers with height of 7¼" require a 3½" minimum embedment of the face bolt using SET-3G adhesive.
7. Alternative anchorage to be designed by others.
8. Table allowable loads were determined using the tested ultimate load with a safety factor of three or fastener calculation values.
9. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical MBHA Skewed Right Installation

MBHU

Masonry Beam Face-Mount Hanger

The MBHU beam hanger provides a face-mounted solution for connecting beams to masonry or concrete walls. A non-welded, one-piece connector, the MBHU is suitable for solid sawn and engineered wood beams as well as trusses. Installation is simplified because the Titen HD® heavy-duty screw anchor and Strong-Drive® SDS Heavy-Duty Connector screws are included with the hanger. Since the Titen HD anchor is installed after the wall is built, locating the anchor in the right spot is easier than with cast-in-place bolts.

Material: 10 gauge

Finish: Galvanized; available in stainless steel

Installation:

- Use all specified fasteners (included).
- Attach hanger to a concrete or grout-filled CMU wall using Titen HD anchors. Note the following:
 - Drill holes using drill bits equal in diameter to the specified Titen HD anchor.
 - Holes shall be drilled $\frac{1}{2}$ " deeper than the specified Titen HD length (i.e. $5\frac{1}{2}$ " for a 5" long Titen HD anchor).
 - Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.
- Carbon-steel Titen HD is not recommended for exposed exterior applications.
- Provide moisture barrier between beam and wall per jurisdictional requirements.

Codes: See p. 13 for Code Reference Key Chart

- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
- Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
- Structural composite lumber (SCL) shall have a minimum specific gravity of 0.5.
- Allowable loads only apply to installation on 8" nominal grouted CMU walls, with a minimum of one horizontal #5 rebar located in the top course.
- Products shall be installed such that Titen HD anchors are not exposed to exterior environments.
- Allowable loads are based upon the tested ultimate load with a safety factor of 3.
- Where noted in table, download listed is for end-of-wall condition. For outside-corner condition, download is 3,640 lb.
- For stainless-steel MBHU models, use ¾"x6" Type 316 stainless steel Titen HD anchors to achieve tabulated loads.
- Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Installation Away from Edge of Wall
(maximum load)

Installation on End of Wall
(minimum load)

H/LTA2

Seismic and Hurricane Ties / Lateral Truss Anchor

The Hurricane Tie series features various configurations of wind and seismic ties for trusses and rafters.

The H10S provides a high-capacity connection from truss/rafter to wall. Also suitable for wood-to-wood applications (see pp. 287–289).

The HM9 is designed to retrofit roof truss/rafters for block construction. The HM9 hurricane tie provides high uplift and lateral capacity using Titen Turbo™ concrete and masonry screws.

The presloped 5/12 seat of the H16 provides for a tight fit and reduced deflection. The strap length provides for various truss heights up to a maximum of 13½". Minimum heel height for H16 series is 4".

The LTA2 is an embedded truss anchor for grout-filled CMU and concrete walls that develops high loads with shallow embedment. Designed for 2x4 minimum truss chords, the LTA2 resists uplift and lateral loads parallel and perpendicular to the wall with a minimum heel height requirement.

Material: H Ties — see table; LTA2 — 18 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Products shall be installed such that the Titen Turbo screws and Titen HD® screw anchors are not exposed to the exterior environment.

H Ties:

- Connectors attached using hex head Titen Turbo screws.
- Attach to grouted concrete block with a minimum one #5 rebar horizontal in the course.
- Hurricane ties do not replace solid blocking.

LTA2:

- Whether in grout-filled CMU or concrete, the LTA2 must be embedded to the depth of the embedment line stamped on the part.
- A minimum of one horizontal #5 rebar is required at top of concrete or in the top course of grout-filled CMU.
- For parallel-to-wall applications, install the LTA2 with flanges facing the center of the wall. Minimum edge distance of 1½" required.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. HGAM10KTA allowable loads are for one anchor. A minimum rafter thickness of 2 1/2" must be used when framing anchors are installed on each side of the rafter or truss.
3. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
4. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
5. The HM9KT and HGAM10KTA are kits with (20) HM9 and (10) HGAM10 connectors packaged with Strong-Drive® SDS Heavy-Duty Connector screws and 2 1/4" and 2 3/4" Titen Turbo screws, respectively. (1 3/4" Titen Turbo screws for concrete installations sold separately.)
6. See p. 367 for Titen Turbo screw information.
7. HGAM10 F₂ loads are for forces into the connector. F₂ loads away from the connector are 640 lb. (DF/SP) and 460 lb. (SPF/HF).
8. LTA2 allowable uplift on SP is 1,350 lb. for perpendicular-to-wall installation and parallel-to-wall installation.
9. **Fasteners:** Nail dimensions are listed diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. Titen Turbo screws are Simpson Strong-Tie concrete and masonry screws (hex-head model required). See pp. 23–24 for fastener information.

② HGAM10 Installed into Masonry

③ HM9 Attaching Truss to Masonry

META/HETA/HHETA/HETAL/DETAL/TSS/TBP8

Embedded Truss Anchors and Truss Seat Snap-In

The embedded truss anchor series provides an engineered method to properly attach roof trusses to concrete and masonry walls. The products are designed with staggered nail patterns for greater uplift resistance. Information regarding the use of two anchors on single- and multi-ply trusses is included.

Simpson Strong-Tie provides two different moisture barrier plates between the concrete/masonry and truss. The TSS is a preassembled, companion product of the META and some HETA models. The TBP8 seat plate also provides a moisture barrier installed prior to truss placement. The seat plate is installed with prongs, instead of fasteners.

The DETAL20 combines dual embedded anchors with partially embedded moisture barrier to provide higher lateral and uplift loads.

Material: HHETA — 14 gauge; HETA — 16 gauge; HETAL — strap 16 gauge, truss seat 18 gauge; META — 18 gauge; TSS/TBP8 — 22 gauge; DETAL — 16 gauge (barrier — 18 gauge)

Finish: Galvanized. Some products available in ZMAX® coating or stainless steel.

Installation:

- Use all specified fasteners; see General Notes.
- The META, HETA and HHETA are embedded 4" into a 6" min. concrete beam or 8" nominal grouted block wall; HETAL is embedded 5 1/8"; DETAL is embedded 4 1/2".
- The DETAL20 is installed centered and flush on top of an 8" masonry bond beam or concrete tie beam. The moisture barrier seat bears on masonry face shell or concrete tie beam form boards; the two flanges embed into grout or concrete. The two embedded anchors shall be installed vertically into grout or concrete.
- The TSS moisture barrier may be preattached to the truss using 0.113" x 2" nails.
- For mislocated truss anchors which are greater than 1/8" but less than 1 1/2" from the face of the truss, a shim must be provided. Shim design by truss engineer. When gap is greater than 1 1/2", abandon existing embedded truss anchor and install new anchor per designer.
- Minimum spacing of single anchors is twice the embedment depth for full load. For closer spacing, see loads for double anchor installation.
- In double anchor installations, install anchors with spoons facing outward and straps spaced no more than 1/8" wider than the rafter/truss width. Do not install nails where the straps overlap when wrapped over the rafter/truss.
- Straps do not need to be wrapped over the rafter/truss to achieve tabulated loads, unless noted otherwise.

Codes: See p. 13 for Code Reference Key Chart

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
3. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 2,000$ psi.
4. For simultaneous loads in more than one direction, the connector must be evaluated using either the Unity Equation or the 75% Rule, as described in Straps and Ties General Notes on p. 277.
5. F_1 lateral load toward face of HETAL is 1,870 lb.
6. The HHETA allowable F_1 load can be increased to 435 lb. if the strap is wrapped over the truss and a minimum of 12 nails are installed.
7. The DETAL20 requires six nails installed in the truss seat and six nails in each strap. The HETAL requires five nails installed in the truss seat. For double META/HETA/HHETA installations, install half of the required fasteners in each strap.
8. F_1 lateral loads listed for double META/HETA/HHETA on 2- or 3-ply rafter/truss may cause an additional ¼" deflection beyond the standard ½" limit where the straps are installed not wrapped over the heel as shown.
9. Minimum edge distance for META/HETA/HHETA is 1 ½" for concrete and 2" for masonry. Where edge distance is less than 2" for masonry, the maximum uplift load is 1,005 lb.
10. It is acceptable to use a reduced number of fasteners provided that there is a reduction in uplift allowable load. Calculate the connector allowable load for a reduced number of nails as follows: Allowable Load = (No. of Nails Used) / (No. of Nails in Table) x Table Load. Lateral loads require the lowest six nail holes filled for META and lowest seven nail holes filled for HETA/HHETA.
11. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

MSTAM/MSTCM

Strap Ties

MSTAM and MSTCM models are designed for wood-to-masonry applications.

The MSTC series has countersunk nail slots for a lower nailing profile.

Finish: Galvanized. Some products are available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes
- Attaches to grouted concrete block and wood framing
- Minimum end and edge distance for Titen Turbo™ screws is 1½"

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.

2. Twist straps do not need to be wrapped over the truss to achieve the allowable load.

3. Minimum edge distance for Titen Turbo screw is 1 1/2".

4. See p. 367 for Titen Turbo screw information.

5. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.

6. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.

7. Lateral loads apply when the first seven nail holes on the truss/rafter near the bend line are filled.

Any other fasteners required can be installed in any open hole.

8. **Fasteners:** Nail dimensions are listed diameter by length. Titen Turbo screws are Simpson Strong-Tie concrete and masonry screws (hex-head model required). See pp. 23–24 for fastener information.

FGTR/LGT/VGT

Retrofit Girder Tiedowns

The LGT, VGT and FGTR products are moderate-to-high load capacity girder tiedowns for new or retrofit applications.

LGT connectors provide a low-profile connection to the wall for easy installation of drywall. Simple to install and can be installed on the inside or outside of the wall.

The VGT variable girder tiedown is a higher capacity alternative to the LGT and MGT for girder trusses. It attaches with Strong-Drive® SDS Heavy-Duty Connector screws to the side of truss and features a predeflected crescent washer that allows it to accommodate top chord pitches up to 8/12. The VGT is also available with one flange concealed for attachment to trusses with no tail.

The FGTR face-mount girder tiedown is a non-pitch specific girder tiedown that offers the highest uplift capacity for retrofit applications. The FGTRHL/R is designed for corner hip applications.

Material: VGT — 7 gauge; LGT2 — 14 gauge; LGT3/LGT4 — 12 gauge; FGTR — straps: 7 gauge, plate: 3 gauge

Finish: VGT, LGT — galvanized; FGTR — powder coated

Installation:

- Use all specified fasteners; see General Notes.
- Connectors attached using Titen Turbo™ screws shall use hex head models.
- To achieve the loads listed in the table below, the product shall be attached to a grouted and reinforced block wall or a reinforced concrete wall designed by others to transfer the high concentrated uplift loads to the foundation.
- Strong-Drive SDS Heavy-Duty Connector screws included with LGT3, LGT4, VGT series and FGTR series.
- Products shall be installed such that Titen Turbo screws and non-stainless Titen HD® anchors are not exposed to the exterior environment.

VGT/FGTR:

- Screw holes are configured to allow for double installation on a two-ply (minimum) truss.
- The product can be installed in a single application or in pairs to achieve a higher uplift capacity.
- Can be installed on roof pitches up to 8/12 or on a bottom chord designed to transfer the loads.
- FGTR — Only two of the four holes provided on each strap are required to be filled to achieve the catalog loads. The first Titen HD anchor $\frac{1}{2}$ " x 5" (THD™ included) shall be installed a minimum of 4" from the top of the wall. Anchors shall not be installed in adjacent holes.
- VGT — When installed on trusses with no overhangs, specify VGTR/L.
- VGT — Install washer component (provided) so that top of washer is horizontal as well as parallel with top of wall.

Codes: See p. 13 for Code Reference Key Chart

- Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- To achieve the loads listed for the VGT single- and double-connector options, anchorage into a 8" wide concrete tie-beam or grouted and reinforced CMU bond beam can be made using SET-3G™, AT-3G™ or ET-3G™ anchoring adhesive with a minimum embedment depth of 12", with a minimum end distance of 12", and centered in the 8" member. Vertical reinforcement may be required to transfer the loads per designer. Alternate anchorage solutions may be determined by designer.
- Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
- Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
- FGTR — minimum edge distance for Titen HD® anchor is 4".
- FGTR — Titen HD anchors should be spaced in every other hole on the part.
- FGTR — Titen HD anchors and Strong-Drive® SDS Heavy-Duty Connector screws are provided with the part.
- For a single FGTR corner installation (4" min. end distance for Titen HD anchors), allowable uplift is 4,425 lb. (DF/SP) and 3,400 lb. (SPF/HF).
- LGT2 — F_1 load = 700 lb.; F_2 load = 170 lb.; LGT3 — F_1 load = 795 lb.; F_2 load = 385 lb.; LGT4 — F_1 load = 2,000 lb.; F_2 load = 675 lb.
- For concrete wall applications, use 1/4" x 1 3/4" Titen Turbo screws.
- Strong-Drive SDS Heavy-Duty Connector screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a 5/32" bit maximum).
- See p. 367 for Titen Turbo screw information.
- Fasteners:** Nail dimensions are listed diameter by length.
SDS screws are Simpson Strong-Tie Strong-Drive screws.
Titen Turbo screws are Simpson Strong-Tie concrete and masonry screws (hex-head model required). See pp. 23–24 for fastener information.

Typical FGTR
Single Installation

Moisture barrier
not shown (typ.)

Typical FGTR
Double Installation

MGT/HGT

Girder Tiedowns

The MGT and HGT series are girder tiedowns for moderate to high load applications that are typically installed prior to roof sheathing. The MGT can wrap over the heel and is anchored on one side of the truss. The HGT straddles the heel and anchors on both sides of the truss. The HGT is field-adjustable, making it suitable for trusses with top chord slopes up to 8/12. The HGT is available in sizes for two-, three- and four-ply widths.

Material: MGT — 12 gauge; HGT — 7 gauge

Finish: MGT — galvanized; HGT — Simpson Strong-Tie gray paint

Installation:

- Use all specified fasteners; see General Notes
- When the HGT-3 is used with a two-ply girder or beam, shimming is required and must be fastened to act as one unit
- Attach to grouted concrete block with a minimum one #5 rebar horizontal in the top lintel block
- MGT — May be installed with straps straight vertically on minimum 5½"-wide truss web, or with straps wrapped over truss heel. For wrapped installations, install minimum of six nails into the face of the roof member on the same side as MGT base.
- See pp. 295–296 for wood applications

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

Typical MGT Installation

Typical HGT-2 Installation into Concrete

Model No.	W (in.)	O.C. Dimension Between Anchors (in.)	Fasteners (in.)		Allowable Uplift Loads		Code Ref.
			Girder	Concrete and GFCMU Anchor	DF/SP (160)	SPF/HF (160)	
MGT	3¾	—	(22) 0.148 x 3	(1) ¾	4,365	3,750	IBC®, FL, LA
HGT-2	3⅝	5¾	(16) 0.148 x 3	(2) ¾	10,345	8,535	
HGT-3	4⅞	7¾	(16) 0.148 x 3	(2) ¾	10,440	8,615	
HGT-4	6⅞	9	(16) 0.148 x 3	(2) ¾	11,395	9,370	

1. Attached members must be designed to resist applied loads.
2. Concrete shall have a minimum compressive strength of $f'_c = 2,500$ psi.
3. Grout-filled CMU (GFCMU) shall have a minimum compressive strength of $f'_m = 1,500$ psi.
4. To achieve the loads listed for the MGT and HGT, install **SET-3G™** or **ET-3G™** anchoring adhesive into a 8"-wide concrete tie-beam or grouted and reinforced CMU bond beam with a minimum embedment depth of 12". Vertical reinforcement may be required to transfer the loads per designer. Alternate anchorage may be determined by designer.
5. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
6. MGT allowable loads are based on installation on a minimum 2-ply wood truss or beam. For single-ply applications, install MGT with (22) 0.148" x 1.5" nails for uplift of 3,165 lb. (DF), 3,275 lb. (SP) and 2,720 lb. (SPF/HF).
7. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

CCQM™/CCTQM™/ECCLQM™/CCCQM/ECCLQMD**Column Caps for GFCMU and Concrete Piers**

The CCQM/CCTQM/CCCQM/ECCLQM embedded column caps are designed for use in raised pier foundations and applications where heavy timbers rest on concrete or concrete block columns. The heavy-gauge beam seats and unique SSTB-style anchor bolts provide the high uplift and lateral resistance needed to help resist high-wind events. The ECCLQMD is a variation that incorporates an additional seat to support a third member at the corner connection. The CCCQM is a variation that incorporates a stirrup on each side for intermediate support beams perpendicular to the main channel.

Framing is fastened with Strong-Drive® SDS Heavy-Duty Connector screws (included) that install with no predrilling and feature a corrosion-resistant double-barrier coating.

CCQM — Intended for use along a floor support beam and non-corner locations

CCTQM — Also for use along a floor support beam and non-corner locations with a side stirrup that accommodates intermediate support beams coming at 90°

CCCQM — For use along a floor support beam with a stirrup on each side of the main channel that accommodates intermediate support beams coming at 90°

ECCLQM-KT — Intended for use at the corners with MSTQM straps to make the connection from the ECCLQM to the wall framing above

ECCL/RQMD-KT — Ideal for applications where a member is needed off the corner of the structure, such as a deck joist/beam

Material: Column caps — 7 gauge;
strap (MSTQM) — 12 gauge

Finish: Column caps — hot-dip galvanized or Simpson Strong-Tie gray paint; strap (MSTQM) — galvanized (ZMAX®)

Installation:

- Use all specified fasteners; see General Notes
- Reference [Post-to-Beam Selector web application at app.strongtie.com/pbs](https://app.strongtie.com/pbs) for ordering assistance

Options:

- For variable widths on side stirrups specify W₃ or W₄ (3¼" to 7½") and add an "X" to the end of the core model name. Example: CCTQM5.50X-SDSG, W₃ = 3¾".

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. Total uplift load and lateral load is based on tested anchor failure in the pier.
3. Allowable loads are based on either a 16" square grout-filled CMU pier with f'_m of 1,500 psi or a 16" square CMU shell filled with 3,000 psi concrete. A minimum of four #7 vertical rebars are required. The designer shall design and detail the GFCMU/concrete pier to resist all forces including uplift, shear and moment.
4. Pier height per designer.
5. Side beam and main beam uplift loads assume DF/SP members and are not additive.
6. The allowable loads listed for grout-filled CMU apply to solid concrete piers of 2,500 psi concrete a minimum of 16" square.
7. The allowable loads listed for CMU shell-filled with 3,000 psi concrete apply to solid concrete piers of 3,000 psi concrete a minimum of 14" square.
8. The ECCLQM-KT is a kit packaged with two MSTQM straps and (32) ¼" x 2½" Strong-Drive® SDS Heavy-Duty Connector screws. One strap may be installed on each face of the ECCLQM, using the SDS Heavy-Duty Connector screws in the beams and (26) 0.162" x 2½" nails (sold separately) in the wall framing. The MSTQM strap's allowable tension load is 6,240 lb. If straps are not installed, table uplift applies to beam only.
9. The ECCLQMDG-KT is a kit packaged with two MSTQM straps and (32) ¼" x 2½" Strong-Drive SDS Heavy-Duty Connector screws. The allowable download for the deck joist connection requires 2-2x deck joist. For single 2x joist, allowable download is 5,240 lb.
10. Any side stirrup not fully supported by grout- or concrete-filled CMU has an allowable download of 7,000 lb.
11. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

BT/BTB/BTH™

Brick Ties

Brick ties provide a connection between the wood structure and brick veneer.

The new, high-performance BTH brick tie is a tested solution for connecting masonry veneer to wood structures across airspaces from 2" to 3", providing the flexibility needed to meet the veneer spacing requirements.

The new BTH design adds strength and versatility, making this tie the ideal solution for varied jobsite conditions. It's field-adjustable in two places and can be installed with either side facing up.

Use existing Simpson Strong-Tie brick ties, BT and BTB, for 1" prescriptive code airspace requirement, or at a closer spacing for airspaces from 1" to 2".

Material: 22 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- BTH — Can be installed bent up or bent down

Codes: 2012 IRC® R703.7.4; 2015, 2018 and 2021 IRC R703.8.4

To Order:

BT-R100 = retail pack of 100

BTB = bulk carton of 500

BTH = bulk carton of 500

Brick Tie Spacing Table

Model No.	Fastener (in.)	Airspace	Max. Wall Area (sq. ft.) Supported per Tie	Maximum Vertical Tie Spacing (in.)		Code Ref.
				Installation on Every Stud (16" o.c.)	Installation on Every Other Stud (32" o.c.)	
BTB and BT	(1) 0.131 x 2 1/2	1"	2.67	24	12	IBC®, FL, LA
		>1" to ≤ 2"	2.00	18	9	
BTH	(1) 0.131 x 2 1/2	2"–3"	2.67	24	12	

1. 1" airspace based on table R703.8.4(1) in 2018 IRC; airspaces larger than 1" are based on testing.
2. Spacing does not pertain to applications where wind pressures exceed 30 psf, or in seismic design categories listed in Section R703.8.4, 2018 IRC.
3. Embed ties per Section R703.8.4, 2018 IRC.
4. BTH maximum vertical offset from center of nail to the bottom of the horizontal leg is 1" for airspaces up to and including 2 3/4", and 3/4" for airspaces greater than 2 3/4" and up to 3".

Typical BT Installation

BTH adjusts for airspaces from 2"–3", and allows for minimum 1 1/2" mortar embedment.

Typical BTH Installation

ICFVL™

Ledger Connector System

The ICFVL ledger connector system is engineered to solve the challenges of mounting wood or steel ledgers to insulated concrete form (ICF) walls up to 4½" in thickness as specified by the designer. The ICFVL6 maximum ICF foam wall thickness is 3¼", the ICFVL8 maximum ICF foam wall thickness is 4½". The ICFVL is designed to provide both vertical and lateral in-plane performance. The system offers many benefits over traditional anchor bolting, including better on-center spacing in most cases, faster installation and no protrusions.

The embedded legs of the ICFVL (ICFVL6 = 6", ICFVL8 = 8") are embossed for additional stiffness and the hole enables concrete to flow through and around the connector. The exposed flange on the face of the ICF provides a structural surface for mounting wood ledger. **Note:** For wood ledger applications, the ICFVL-W or ICFVL-CW is required (sold separately).

Features:

- Two size options to accommodate up to 4½" thick ICF foam walls.
- Embossments on the embedded legs for additional stiffness.
- Two diamond-shaped holes in the center of the connector allow screw installation to hold it in place during concrete pour and to aid in proper alignment during installation. (Remove center screws prior to ledger installation.)

Material: ICFVL — 14 gauge; ICFVL-CW and ICFVL-W — 16 gauge

Finish: Galvanized

Installation:**ICFVL in ICF**

- For use with a minimum 4" thick core
- Snap a chalk line for the bottom of the ledger
- Mark required on-center spacing
- Use ICFVL to mark kerfs locations
- Cut kerfs as marked
- Insert ICFVL flush to the face of the ICF
- Pour concrete

Wood Ledger Attachment — ICFVL-W or ICFVL-CW

- Slip appropriate ledger connector underneath the ledger.
- Install the eight ICF-D3.25 screws partially into the ledger. ICF-D3.25 installs best using a low-speed drill with ⅜" hex-head driver.
- For denser wood species (specific gravity ≥ 0.50), predrilling may be necessary. Predrill ledger only with ⅜" drill bit.
- Position bottom of the ledger level to the chalk line and drive the screws through the wood and into the ICFVL.

Steel Ledger Attachment

- Position bottom of the ledger level to the chalk line and against the ICFVL.
- Attach with four #14 x ¾", #3 drill point screws (not provided)
- All screws should be located at least ½" from the edge of the ICFVL
- Space screws evenly

Codes: See p. 13 for Code Reference Key Chart

ICFVL

ICFVL-W and
ICFVL-CW

Typical Wood Ledger Installation with ICFVL8

Warning:
Industry studies show that hardened fasteners can experience performance problems in wet environments. Accordingly, use this product in dry environments only.

ICFVL™

Ledger Connector System (cont.)

Ledger Type	Fasteners	Allowable Loads (lb.)	
		Vertical (F _v)	Lateral (F _t)
Wood	(8) ICF-D3.25	2,280	1,265

1. Use (8) ICF-D3.25 screws (provided).
2. Loads apply to ICF with 4½" maximum foam thickness with the ICFVL8 and 3¼" maximum foam thickness with the ICFVL6.
3. Loads assume a minimum spruce-pine-fir ledger.
4. Loads may not be increased for short-term loading.
5. The top of the ICFVL must be installed 4" minimum below the top of the wall.
For installations where the ICFVL is installed less than 4" from the top of the wall (including flush), multiply the allowable loads by 0.94.

This table address vertical load applications only.

Ledger Type	Connector Type	ICFVL Spacing To Replace Anchor Bolts (in.) ^{1,2,3}																Code Ref.
		½"-Diameter Anchors at				¾"-Diameter Anchors at				(2) ¾"-Diameter Anchors at				¾"-Diameter Anchors at				
		12" o.c.	24" o.c.	36" o.c.	48" o.c.	12" o.c.	24" o.c.	36" o.c.	48" o.c.	12" o.c.	24" o.c.	36" o.c.	48" o.c.	12" o.c.	24" o.c.	36" o.c.	48" o.c.	
Wood Ledgers																		
DF/SP/SPF	ICFVL w/ ICFVL-W	48	48	48	48	48	48	48	48	24	48	48	48	42	48	48	48	—
LVL	ICFVL w/ ICFVL-CW	48	48	48	48	48	48	48	48	24	48	48	48	42	48	48	48	
Steel Ledgers																		
68 mil (0.068")	ICFVL	11	22	33	44	9	18	27	36	—	—	—	—	—	—	—	—	—
54 mil (0.054")	ICFVL	15	30	45	48	12	24	36	48	—	—	—	—	—	—	—	—	

1. The designer may specify different spacing based on the load requirements.
2. Spacings are based on the perpendicular-to-grain capacity of the bolt in the wood ledger compared to the tested value of the ICFVL.
Additional connectors are required for out-of-plane loads.
3. See flir F-C-ICFVL at strongtie.com for additional connection details.
4. For steel ledgers, the 68 mil ledger spacing is closer than the 54 mil ledger because the calculated load of a bolt is higher in a thicker piece of steel.
5. Steel ledger values are based on steel. $F_u = 60$ ksi.
6. Values shown apply to ICF foam thicknesses up to 3¼" for ICFVL6 and 4½" for ICFVL8.

ICFVL

Typical Wood Ledger Installation
with ICFVL and ICFVL-W

Misinstallation

Straps and Ties General Notes

These general notes are provided to ensure proper installation of Simpson Strong-Tie straps and ties.

- The (160) loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
- When installing strap over $\frac{5}{8}$ " maximum wood structural panel sheathing, use 2½"-long nails minimum.
- SD screws are Simpson Strong-Tie Strong-Drive® SD Connector screws. See pp. 23–24 for additional fastener information.
- For straight straps in tension, use half of the fasteners in each member being connected to achieve the listed loads.
- Tension loads apply for uplift when installed vertically.
- Field-bending straps is not recommended unless otherwise noted.
- If wood splitting is a concern, consider spacing the nails at every other location.
- The cut length of coil strap shall be equal to twice the "end length" noted in the tables plus the clear-span dimension.
- Straps 16 ga. and heavier can be fillet welded to structural steel members. The designer shall specify the weld size and length. Welding and specification shall be in compliance with the current American Welding Society ANSI/AWS D1.3, Structural Welding Code – Sheet Steel.
- Straps and ties can be installed on either the interior or exterior of the wall provided that connections contributing to an uplift continuous load path are on the same side of the wall (i.e., truss/rafter-to-plate connector, plate-to-stud connector).
- Hurricane tie installations on the exterior of the wall assume a minimum truss/rafter overhang of 3½".

Load Adjustment Factors for Optional Fasteners Used with Straight Straps

Connector Table Nail	Replacement Fastener	Allowable Load Adjustment Factor
0.131" x 1½"	#9 x 1½" SD Connector screw	1.00
0.131" x 2½"	0.131" x 1½"	1.00
	#9 x 1½" SD Connector screw	1.00
0.148" x 1½"	#9 x 1½" SD Connector screw	1.00
	0.131" x 1½"	0.83
0.148" x 2½" 0.148" x 3" 0.148" x 3¼"	0.131" x 1½"	0.83
	0.131" x 2½"	0.83
	0.148" x 1¼"	1.00 ⁶
	0.148" x 1½"	1.00 ⁶
	0.148" x 2½"	1.00
	0.148" x 3¼"	1.00
	#9 x 1½" SD Connector screw	1.00
	#9 x 2½" SD Connector screw	1.00
0.162" x 2½" 0.162" x 3½"	0.148" x 1½"	0.84 ⁵
	0.148" x 2½"	0.84
	0.148" x 3"	0.84
	0.148" x 3¼"	0.84
	0.162" x 2½"	1.00 ⁶
	#10 x 1½" SD Connector screw	1.00
	#10 x 2½" SD Connector screw	1.00

- Allowable load adjustment factors shown in the table are applicable to all straight straps throughout this catalog, except as noted in the footnotes below.
- Some products have been tested specifically with alternative fasteners and have allowable load adjustment factors or reduced capacities published on the specific product page. Values published on the product page may be used in lieu of using this table.
- For straps installed over $\frac{5}{8}$ " maximum wood structural panel sheathing, use a 2½"-long fastener minimum.
- This table does not apply to straps made of steel thicker than 10 ga.
- Where noted, use 0.80 for 10 ga., 11 ga., and 12 ga. products when using SPF lumber.
- Where noted, use 0.92 for 10 ga., 11 ga., and 12 ga. products when using SPF lumber.

When installing floor-to-floor straps, wood shrinkage and compression that occurs during construction may cause the straps to bow out if both ends of the strap are nailed during initial installation.

To prevent this, filling all fastener holes in the strap (including the rim joist area) will limit the bowing. Alternatively, fill the holes in the top of the strap before the roof is installed and then filling the bottom half of the strap after will also help reduce bowing.

Not Sure How Much Coil Strap You Need?

Simpson Strong-Tie has a web-based app, the **Coil Strap Calculator**, which can help you quickly determine the cut length of each strap and the total amount of coil strap needed for each application on a project.

Visit app.strongtie.com/csc for more information or to access the web application.

Straps and Ties General Notes

Considerations for Hurricane Tie Selection

1. What is the uplift load?
2. What is the parallel-to-plate (F_1 lateral) load?
3. What is the perpendicular-to-plate (F_2 lateral) load?
4. What is the species of wood used for the rafter and the top plates? (Select the load table based on the lowest performing species of wood.)
5. Will the hurricane tie be nailed into both top plates or the upper top plate only?
6. What load or loads will the hurricane tie be taking?

The Roof-to-Wall Selector allows you to find the most cost-effective connector based on installation type, connector options and demand loads with assistance of 3D visualization.

Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

Simultaneous Loads

When a connector is loaded simultaneously in more than one direction, the allowable load must be evaluated as option 1 or 2.

Option 1: Unity Equation

For all connectors use the following equation:

Design Uplift / Allowable Uplift + Design Lateral Parallel to Plate / Allowable Lateral Parallel to Plate + Design Lateral Perpendicular to Plate / Allowable Lateral Perpendicular to Plate < 1.0.

The three terms in the unity equation are due to the possible directions that exist to generate force on a connector. The number of terms that must be considered for simultaneous loading is at the sole discretion of the designer and is dependent on their method of calculating wind forces and the utilization of the connector within the structural system.

Option 2: 75% Rule

As an alternative, certain roof-to-wall connectors (embedded truss anchors, pp. 264–265, seismic and hurricane ties, pp. 287–290, and twist straps, p. 294) can be evaluated using the following: The design load in each direction shall not exceed the published allowable load in that direction multiplied by 0.75.

7. Select hurricane tie based on performance, application, installed cost and ease of installation.

Some hurricane ties and twist straps can be installed in pairs to achieve a higher load. Both connectors shall be the same model. Refer to the *High Wind Guide*, F-C-HWG, at strongtie.com.

Install diagonally across from each other for minimum 2x truss.

Products can be on the same side of the wall provided they are configured as shown.

Avoid a Misinstallation

Do not make new holes or overdrive nails.

Nailing into both sides of a single 2x truss may cause the wood to split.

HRS/HTP/LSTA/LSTI/MST/MSTA/MSTC/MSTI/ST

Strap Ties

Straps are designed to transfer tension loads in a wide variety of applications.

HRS — Heavy strap designed for installation on the edge of 2x members. The HRS416Z installs with Strong-Drive® SDS Heavy-Duty Connector screws.

HTP — Heavy tie plate designed for installation on the side of 2x4 or larger members.

LSTA and MSTA — Designed for use on the edge of 2x members, with a nailing pattern that reduces the potential for splitting.

LSTI and MSTI — Light and medium straps that are suitable where pneumatic-nailing is necessary through diaphragm decking and wood chord open-web trusses.

MST — High-capacity strap that can be installed with either nails or bolts. Suitable for double 2x member connections or greater.

MSTC — High-capacity strap that utilizes a staggered nail pattern to help minimize wood splitting. Nail slots have been countersunk to provide a lower nail head profile.

ST — Light and medium precut straps for quick installation.

Finish: Galvanized. Some products are available in stainless steel, ZMAX® coating or black powder coat (add PC to SKU).

Installation: Use all specified fasteners; see General Notes.

Options: Special sizes can be made to order; contact Simpson Strong-Tie

Codes: See p. 13 for Code Reference Key Chart

MSTC and RPS meet code requirements for reinforcing cut members (16 gauge) at top plate and RPS at sill plate. International Residential Code® — 2012/2015/2018/2021 R602.6.1

International Building Code® — 2012 2308.9.8; 2015/2018/2021 2308.5.8

(For RPS, refer to p. 321. For CTS218 compression and tension strap, see p. 319.)

MST72		2 1/8	72	(68) 0.162 x 2 1/2	10	1/2	6,730	4,490	6,475	4,150	

- See pp. 276–277 for Straps and Ties General Notes.
- Install bolts or nails as specified by designer. Bolt and nail values may not be combined.
- Allowable bolt loads are based on parallel-to-grain loading and minimum member thickness: MST – 2 1/2".
- Splitting may be a problem with installations on lumber smaller than 3 1/2"; either fill every nail hole with 0.148" x 1 1/2" nails or fill every other hole with 0.162" x 2 1/2" nails. Reduce the allowable load based on the size and quantity of fasteners used.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

T/L/HT/HL/HTQ

Strap Ties

T and L strap ties are versatile utility straps used for stronger 90° connections. The 1616HTQ installs faster and easier with the patented Strong-Drive® SDWH™ Timber-Hex HDG screws (screws not included). Additional black powder coated strap ties also available. See Decorative Hardware section, p. 348 for more information.

Finish: L and T — Galvanized; also available HDG (except 55L); HL and HT — Galvanized; also available HDG or black powder coat (add HDG or PC to sku); HTQ — HDG

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Ga.	Dimensions (in.)			Fasteners			Code Ref.
		L	H	W	Nails (in.)	Qty.	Boots Dia.

128T	14	12	8	2	(12) 0.162 x 2 1/2	3	1/2"	
1212T	14	12	12	2	(12) 0.162 x 2 1/2	3	1/2"	

1. These connectors are not load rated; may be installed with nails or bolts.
2. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical T Installation

Typical L Installation

Model No.	Ga.	Dimensions (in.)			Minimum Bolt End and Edge Distances (in.)		Fasteners	Allowable Loads		Code Ref.
		L	H	W	d1	d2		Tension/Uplift (100/160)	F1 (100/160)	
1212HL	7	12	12	2 1/2	2 1/2	4 3/4	(5) 5/8" bolts	1,535	565	—
1616HL	7	16	16	2 1/2	2 1/2	4 3/4	(5) 5/8" bolts	1,535	565	
1212HT	7	12	12	2 1/2	2 1/2	4 3/4	(6) 5/8" bolts	2,585	815	
1616HT	7	16	16	2 1/2	2 1/2	4 3/4	(6) 5/8" bolts	2,585	815	
1616HTQ	7	16	16	2 1/2	—	—	(10) SDWH27400G	2,670	870	

1. 1212HL, 1616HL, 1212HT and 1616HT are to be installed in pairs with bolts in double shear and assume a minimum member thickness of 3 1/2". A single part with bolts in single shear is not load rated.
2. 1616HTQ loads are for a single part and may be doubled when installed in pairs on opposite sides of a minimum 5 1/2" thick member.
3. 1212HT, 1616HT and 1616HTQ loads assume a continuous beam.
4. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
5. **Screws:** SDWH27400G = 0.27" diameter x 4" long Strong-Drive SDWH Timber-Hex HDG screw. Longer SDWH27G screws may be used.

Typical 1616HTQ Installation

55L

1212HT

1212HL

1616HTQ

PS/PSQ™/HST

Strap Ties

PS/PSQ pile straps are ideal for attaching girders to piles, bringing strength to the connection when the wood members are notched. The PSQ installs faster and easier with the patented Strong-Drive® SDWH™ Timber-Hex HDG screws and offers higher loads. (Screws not included.)

Finish: PS/PSQ — HDG; also available in black powder coat (add PC to sku)

HST2 and HST5 — Galvanized

HST3 and HST6 — Simpson Strong-Tie gray paint

Material: See table

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/pbs to access our Post-to-Beam Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Ga.	Dimensions (in.)		Fasteners (Total)	DF/SP Allowable Tension Loads	SPF/HF Allowable Tension Loads	Code Ref.
		W	L		(160)	(160)	
PS218	7	2	18	(4) 3/4" bolts	1,740	1,385	—
PS418		4	18	(4) 3/4" bolts	1,740	1,385	
PS720		6 3/4	20	(8) 1/2" bolts	3,075	2,645	
PSQ218		2	18	(8) SDWH27400G	2,815	2,420	
PSQ418		4	18	(8) SDWH27400G	3,045	2,620	

- See pp. 276–277 for Straps and Ties General Notes.
- Posts and beams may consist of multiple members provided they are connected independently of the strap fasteners.
- PSQ loads are per part (not pair). F₁ loads on DF/SP for PSQ218 and PSQ418 are 750 lb. and 780 lb., respectively. SPF/HF F₁ loads are 645 lb. and 670 lb.
- PS loads are per part (not pair). Loads are based on perpendicular-to-grain loading in the beam and parallel-to-grain loading in the post and assume a minimum member thickness of 3 1/2". PS straps must be positioned such that bolt end and edge distances meet NDS minimum requirements.
- All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
- Screws:** SDWH27400G = 0.27" diameter x 4" long Strong-Drive SDWH Timber-Hex HDG screw. (Longer SDWH27G screws may be used.)

Typical PS720 Installation

Typical PSQ Installation

SDWH27400G

	Model No.	Ga.	Dimensions (in.)		Fasteners (in.)		DF/SP Allowable Tension Loads	SPF/HF Allowable Tension Loads	Code Ref.	
			W	L	Nails	Bolts		Bolts		Bolts
						Qty.	Dia.	(160)		(160)

- See pp. 276–277 for Straps and Ties General Notes.
- Allowable bolt loads are based on parallel-to-grain loading and these minimum member thicknesses: HST2 and HST5 — 3 1/2"; HST3 and HST6 — 4 1/2".
- All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

HST

CS/CMST/CMSTC

Coiled Straps

Coiled straps are continuous utility straps which can be cut to length at the jobsite. CMSTC provides countersunk nail slots for lower profile when installed with 0.148" x 3 1/4" sinkers.

Finish: Galvanized. Some products available in ZMAX® coating. CS may be ordered in stainless steel (order CS16SS-R).

Material: See table

Installation:

- Use all specified fasteners; see General Notes.
- Wood shrinkage after strap installation across horizontal wood members may cause strap to buckle outward.
- Refer to the applicable code for minimum nail penetration and minimum wood edge and end distances.
- The table shows the maximum allowable loads and the nails required to obtain them. Fewer nails may be used; reduce the allowable load as shown in the table notes or in the Straps and Ties General Notes on pp. 276–277.
- For lap splice and alternate nailing information, refer to p. 285.
- The cut length of the strap shall be equal to twice the "End Length" noted in the table plus the clear span dimension.
- CS straps are available in 25' lengths (add -R to model no.).

CMST:

- Use every other round hole if the wood tends to split.
- Fill round and triangle holes for loads shown. If wood tends to split, fill only round holes and double the end length listed for full load.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/csc to access our Coil Strap Calculator web application.

- See pp. 276–277 for Straps and Ties General Notes.
- Calculate the connector value for a reduced number of nails as follows:

$$\text{Allowable Load} = \frac{\text{No. of Nails Used}}{\text{No. of Nails in Table}} \times \text{Table Load}$$

Example: CMSTC16 in DF/SP with 40 nails total.
(Half of the nails in each member being connected)

$$\text{Allowable Load} = \frac{40 \text{ Nails (Used)}}{50 \text{ Nails (Table)}} \times 4,690 \text{ lb.} = 3,752 \text{ lb.}$$
- See p. 285 for alternate nailing and lap splice information.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

CS/CMST/CMSTC

Coiled Straps (cont.)

Lap splicing of coiled straps can be used to extend standard strap lengths for designing continuous drag elements and diaphragm chord members. The Strap Lap Splices table provides the minimum splice length (L_{sp}) and fasteners, within the splice length, to achieve the highest allowable capacity of the strap.

The Allowable Loads for Alternative Nailing table provides information for coiled straps when installed with different nailing schedules. The highest allowable load given for each model is limited by the steel capacity.

The Engineer/Designer of Record must evaluate and determine the adequacy of the coiled strap's lap splice and alternative nailing applications to meet their design loads.

Strap Lap Splices

Model No.	Ga.	Strap Lap Splice	
		Minimum Fasteners per Splice	Min. Splice Length, L_{sp} (in.)
CMST12	12	(18) 0.162 x 2½	18
		(22) 0.148 x 2½	21
CMST14	14	(13) 0.162 x 2½	14
		(15) 0.148 x 2½	15
CMSTC16	16	(11) 0.162 x 2½	10
		(11) 0.148 x 2½	10
CS14	14	(6) 0.148 x 2½	9
		(7) 0.131 x 2½	10
CS16	16	(5) 0.148 x 2½	8
		(6) 0.131 x 2½	9
CS18	18	(5) 0.148 x 2½	8
		(5) 0.131 x 2½	8
CS20	20	(5) 0.148 x 2½	8
		(5) 0.131 x 2½	8
CS22	22	(4) 0.148 x 2½	5
		(4) 0.131 x 2½	6

- See pp. 276–277 for Straps and Ties General Notes.
- 0.148" x 2½" nails can be replaced by 0.148" x 3¼" nails. No other nail substitution is allowed for lap splices.
- Refer to the applicable code for minimum edge distance and minimum end distance.
- No strap modification is allowed and the splice must meet both the minimum number of fasteners and the minimum splice length.

Allowable Loads for Alternative Nailing

- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

MSTC48B3/MSTC66B3Z

Pre-Bent Straps

The MSTC48B3 and MSTC66B3Z are pre-bent straps designed to transfer tension load from an upper-story shearwall to a beam on the story below.

Material: 14 gauge

Finish: Galvanized. Some products available in ZMAX® coating.

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Min. Wood Beam Dimension (in.)		Fasteners (in.)			Allowable Tension Loads		Code Ref.
			Beam		Studs/ Post			
	Width (min.)	Depth (min.)	Face	Bottom				
						DF/SP	SPF/HF	
						(160)	(160)	
MSTC48B3	3	9¼	(12) 0.148 x 3	(4) 0.148 x 3	(38) 0.148 x 3	3,975	3,900	IBC® FL, LA
MSTC66B3Z	3½	11¼	(14) 0.148 x 3			4,490	4,490	

- Using fewer than 38 nails in the studs/post will reduce the allowable load of the connection. To calculate a reduced allowable load, subtract 199 lb. per missing nail for DF/SP or 172 lb. per nail for HF/SPF.
- Nails in studs/post shall be installed symmetrically. Nails may be installed over the entire length of the strap in the studs/post.
- The minimum 3"-wide beam may be made up of two 2x members.
- MSTC48B3 and MSTC66B3Z installed over wood structural panel sheathing up to 1/2" thick achieve 0.85 of table loads.
- PSL beam may be used in lieu of a standard-dimension lumber beam with no load reductions.
- Multiply allowable loads by 1.85 to attain an allowable load for installations where two straps have been installed with a 1 1/2" clear space between straps.
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See technical bulletin T-C-SCLCLM at strongtie.com for load reductions resulting from narrow-face installations.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

H/TSP

Seismic and Hurricane Ties

Simpson Strong-Tie hurricane ties provide a positive connection between truss/rafter and the wall of the structure to resist wind and seismic forces.

Material: See table

Finish: Galvanized. H1.81Z, H7Z and H11Z — ZMAX® coating. Some models available in stainless steel or ZMAX.

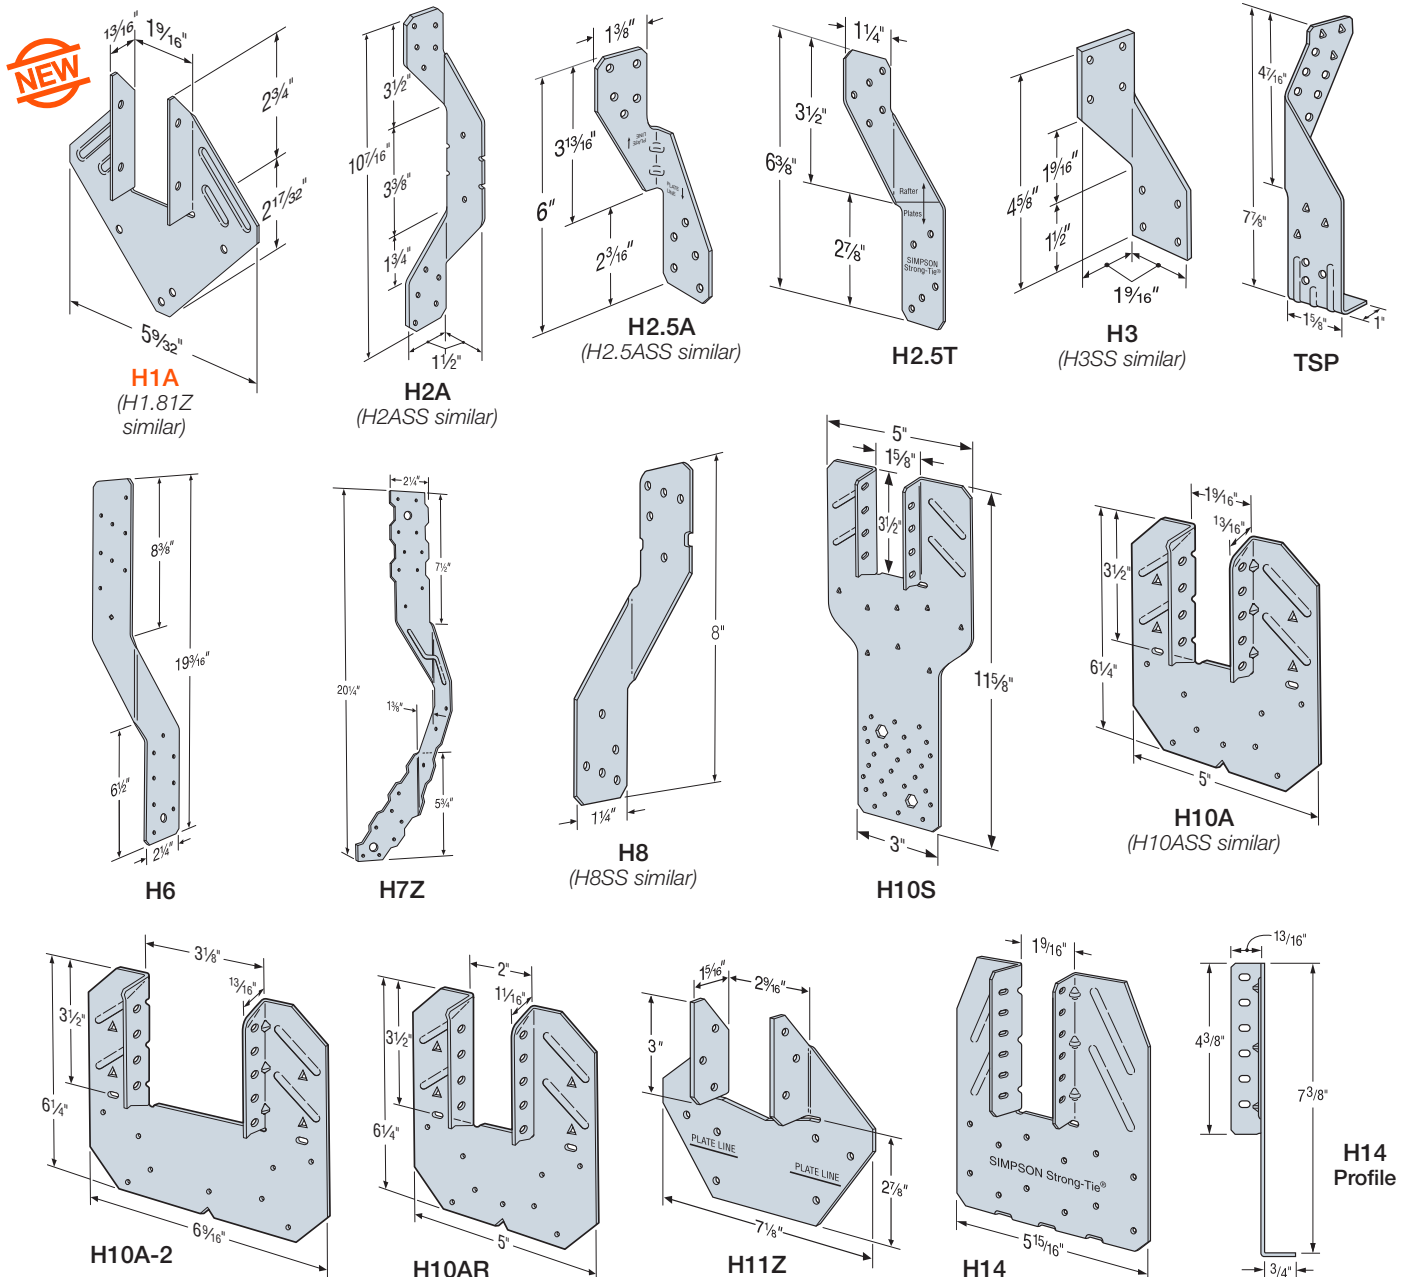

Installation:

- Use all specified fasteners; see General Notes.
- Hurricane ties can be installed with flanges facing inward or outward.
- H2.5T, H3 and H6 ties are shipped in equal quantities of right and left versions (right versions shown).

- Hurricane ties do not replace solid blocking.
- When installing ties on plated trusses (on the side opposite the truss plate) do not fasten through the truss plate from behind. This can force the truss plate off of the truss and compromise truss performance.
- H10A optional nailing to connect shear blocking, use 0.131" x 2½" nails. Slots allow maximum field bending up to a pitch of 6:12, use H10A sloped loads for field-bent installation.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

			(12) 0.131 x 1 1/2	(15) 0.131 x 2 1/2	—	1,340	670	230	—	1,050	480	245	—	
	TSP	16	(9) 0.148 x 1 1/2	(6) 0.148 x 1 1/2	—	755	310	190	—	650	265	160	—	
			(9) 0.148 x 1 1/2	(6) 0.148 x 3	—	1,015	310	190	—	875	265	160	—	

- See pp. 276–277 for Straps and Ties General Notes.
- Allowable loads are for one anchor. A minimum rafter thickness of 2 1/2" must be used when framing anchors are used on each side of the joist and on the same side of the plate (exception: connectors installed such that nails on opposite side don't interfere).
- Allowable DF/SP uplift load for stud-to-bottom plate installation (see detail 12) is 390 lb. (H2.5A); 265 lb. (H2.5ASS); and 310 lb. (H8). For SPF/HF values, multiply these values by 0.86.
- Allowable loads in the F₁ direction are not intended to replace diaphragm boundary members and do not account for possible cross-grain bending of the truss or rafter members.
- When cross-grain bending or cross-grain tension cannot be avoided in the members, mechanical reinforcement to resist such forces shall be considered by the designer.
- Southern pine allowable uplift loads for H10A = 1,105 lb. (160), H2.5A with 0.131" x 1 1/2" nails = 635 lb. (160) and H2.5A with 0.131" x 2 1/2" nails = 730 lb. (160).
- H10S can have the stud offset a maximum of 1" from the rafter (center to center) for a reduced uplift of 890 lb. (DF/SP) and 765 lb. (SPF).
- H10S nails to plates are optional for uplift but required for lateral loads.
- Some load values for the stainless-steel connectors shown here are lower than those for the carbon-steel versions. Ongoing test programs have shown this also to be the case with other stainless-steel connectors in the product line that are installed with nails. Visit strongtie.com/corrosion for updated information.
- The allowable loads of stainless-steel connectors match carbon-steel connectors when installed with stainless-steel Strong-Drive SCNR Ring-Shank Connector nails. For more information, refer to engineering letter L-F-SSNAILS at strongtie.com.
- Simpson Strong-Tie offers stainless-steel Strong-Drive SCNR Ring-Shank Connector nails. For bulk SCNR nails, see p. 359; for collated SCNR nails, see p. 360. For general fastener information, see pp. 23–24.
- Allowable DF/SP/SPF uplift load for the H2.5A fastened to a 2x4 truss bottom chord and double top plates using five 0.131" x 1 1/2" nails in the top plates and three 0.131" x 1 1/2" nails in the lowest three flange holes into the truss bottom chord is 260 lb. (160).
- For TSP installed stud to single plate see pp. 291–293.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.
- Using Strong-Drive SD Connector (SD9112) for 0.131" x 1 1/2" and 0.148" x 1 1/2", Strong-Drive SD Connector (SD9212) for 0.131" x 2 1/2" (and longer) and 0.148" x 2 1/2" (and longer), Strong-Drive SD Connector (SD10212) for 0.162" x 2 1/2" (and longer) will get the same load as nails.

H14 Installation to Double 2x Header

H

Seismic and Hurricane Ties

The hurricane tie series features various configurations of wind and seismic ties for trusses and rafters. The H16 series has a presloped seat of 5/12 for double trusses.

The presloped 5/12 seat of the H16 provides for a tight fit and reduced deflection. The strap length provides for various truss heel heights ranging from 13½" maximum to 4" minimum.

The HGA10 attaches to gable trusses and provides good lateral wind resistance. The HS24 attaches the bottom chord of a truss or rafter at pitches from 0/12 to 4/12 to double 2x4 top plates. Double-shear nailing allows for higher lateral resistance.

Material: See table

Finish: Galvanized; HGA also available in HDG

Installation:

- Use all specified fasteners; see General Notes.
- HGA10KT: sold as a kit with (10) HGA10 connectors and (40) ¼" x 1½" Strong-Drive® SDS Heavy-Duty Connector screws and (40) ¼" x 3" SDS screws. Additional screws sold separately to install with all ¼" x 1½" SDS screws (SDS25112).
- HS24 requires slant nailing only when bottom chord of truss or rafter has no slope.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

H16

Presloped at 5/12.
Pitch of 3/12 to 7/12
is acceptable.

H16 Installation

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Ga.	Fasteners (in.)		DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.

HS24

- See pp. 276–277 for Straps and Ties General Notes.
- When cross-grain bending or cross-grain tension should be avoided in the members, mechanical reinforcement to resist such forces shall be considered by the designer.
- HS24 DF/SP allowable loads without slant nailing are 605 lb. (uplift), 590 lb. (F₁), 640 lb. (F₂). For SPF/HF loads multiply these values by 0.86.
- Allowable loads in the F₁ direction are not intended to replace diaphragm boundary members or prevent cross-grain bending of the truss or rafter members. Additional shear transfer elements shall be considered where there may be effects of cross-grain bending or tension.
- HGA10 loads in table are for when truss is parallel with the wall as depicted in the illustration. If truss is perpendicular to the wall, then uplift is 605 lb., F₁ is 500 lb. and F₂ is 720 lb. for DF/SP. For SPF/HF, multiply load values by 0.72.
- Fasteners:** Nail dimensions in the table are diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

DSP/SSP/SP/SPH/RSP4/TSP/CS

Stud Plate Ties

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The stud plate tie series offers general solutions for connecting the stud to the top and bottom plates. All models can be used to make a connection to either the top or bottom plate, and several are suitable for double top plates and studs.

Material: DSP/SSP/SPH — 18 gauge;
TSP/CS16 — 16 gauge; all others — 20 gauge

Finish: Galvanized. Some products available in ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes.
- TSP/DSP/SSP — Sill-plate installation: fill all round holes.
- TSP/DSP/SSP — Top-plate installation: fill all round and triangle holes.
- SP1/SP2 — One of the 0.148" x 3" stud nails is driven at a 45° angle through the stud into the plate.
- CS — Slide the CS16 or CS20 strap underneath the mudsill with the appropriate length of strap protruding from the inside of the mudsill. See illustration on p. 292 for more details.
 - Each bend in the strap must be tight, and the strap must sit flush against the edge of the mudsill and the stud or sheathing.
 - Bend strap one time only.

Codes: See p. 13 for Code Reference Key Chart

- See pp. 276–277 for Straps and Ties General Notes.
- SP1/SP2 — drive one stud nail at an angle through the stud into the plate to achieve the table load (see illustration).
- RSP4 — see Installation details (1) and (2) for reference.
- RSP4 — F_2 is 225 lb. for Installation 1 and 245 lb. for Installation 2. F_1 load is 165 lb. for both installations.
- Maximum load for SPH in southern yellow pine is 1,415 lb. for center loading and 710 lb. for side loading.
- When cross-grain bending or cross-grain tension cannot be avoided in the members, mechanical reinforcement to resist such forces shall be considered by the designer.
- For retrofit application, use CS16 and CS20. Total length of strap and total nail quantity are listed.
- Use Side (eccentric) load when uplift loads are applied to only one face of the top plate.
- Use Center (concentric) loads when uplift loads are applied at the centerline of the top plate, or where equal loads are applied to both sides of the top plate. Center loads should also be used for stud-to-bottom plate loads.
- Order SPH4R and SPH6R for installation over ½" sheathing with a maximum DF/SP load of 1,360 lb. for center loading.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

			(6) 0.148 x 3	1,015 ⁴					

1. See pp. 276–277 for Straps and Ties General Notes.

2. When cross-grain bending or cross-grain tension cannot be avoided in the members, mechanical reinforcement to resist such forces shall be considered by the designer.

3. Allowable loads for DSP installed to a rim board are 620 lb. (DF/SP) and 515 lb. (SPF/HF).

4. Noted values apply only to DF/SP members. For SPF values, multiply by 0.86.

5. Southern pine allowable uplift load is 520 lb.

6. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

LGT/MGT/VGT/HGT

Girder Tiedowns

The LGT, MGT, VGT and HGT are girder tiedowns for moderate- to high-load capacity applications. The LGT and VGT are also suitable for retrofit applications.

LGT connectors provide a low-profile connection to the studs for easy installation of drywall. Simple to install and can be installed on the inside or outside of the wall. LGT connectors also provide exceptional bearing enhancement for heavy download applications.

The Variable Girder Tiedown (VGT) is a higher capacity alternative to the LGT and MGT for girder trusses. It attaches with Strong-Drive® SDS Heavy-Duty Connector screws to the side of truss and features a predeflected crescent washer that allows it to accommodate top chord pitches up to 8/12. The VGT is also available with one flange concealed for attachment to trusses with no tail.

The HGT offers the highest uplift capacity for girders and can be installed on trusses and beams with top chord slopes up to 8/12.

Material: HGT, VGT — 7 gauge; LGT2 — 14 gauge; MGT, LGT3, LGT4 — 12 gauge

Finish: HGT — Simpson Strong-Tie gray paint; LGT, MGT, VGT — galvanized

Installation:

- When the HGT-3 is used with a 2-ply girder or beam, shimming is required. Fasten shim to act as one unit.
- Before installing fasteners, ensure LGT3-SDS2.5 makes complete contact with bottom of truss.
- Strong-Drive SDS Heavy-Duty Connector screws included with LGT3, LGT4 and VGT series.
- VGT — Can be installed on roof pitches up to 8/12 or on a bottom chord designed to transfer the load.
- VGT — Screw holes are configured to allow for double installation on a two-ply (minimum) truss.
- VGT — When installed on trusses with no overhangs, specify VGTR/L.
- VGT — Install washer component (provided) so that top of washer is horizontal as well as parallel with top-of-wall top plate.
- LGT3-SDS2.5 — The four large hexagon holes are intended for GFCMU and concrete applications.
- MGT — May be installed with straps straight vertically on minimum 5½"-wide truss web, or with straps wrapped over truss heel. For wrapped installations, install minimum of six nails into the face of the roof member on the same side as MGT base.
- See pp. 268–270 for masonry applications.

Codes: See p. 13 for Code Reference Key Chart

- See pp. 276–277 for Straps and Ties General Notes.
- LGT2 — F₂ load requires installation of four 0.148" x 3¼" sinkers or four #9 x 1½" SD Connector screws (SD) in optional nail holes.
- LGT4 — F₂ load requires installation of seven 0.148" x 3¼" sinkers in optional nail holes.
- LGT4 — Uplift for DF/SP girder and SPF studs is 3,860 lb.
- LGT connectors can provide bearing enhancement loads for truss download reactions. For more information, refer to technical bulletin T-C-HTIEBEAR at strongtie.com.
- LGT2 installed with #9 x 1½" SD Connector screws (SD) will achieve double the uplift load when installed on opposite sides of the top plates, but on separate truss members. See typical back-to-back LGT2 installation detail.
- Girder tiedowns installed on the outside of the wall require a 3½" overhang to achieve table loads.
- Strong-Drive® SDS Heavy-Duty Connector screws (SDS) may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2014, Sections 7.5.3.4 and 8.9.2 are met (predrilling required through the plate using a ½" bit maximum).
- The allowable uplift load listed is for the girder tiedown and anchor rods only. The allowable uplift of the holdown or other anchorage must be checked.
- Fasteners:** Nail dimensions are listed diameter by length. SD and SDS screws are Simpson Strong-Tie Strong-Drive screws. See pp. 23–24 for fastener information.

LTS/MTS/HTS

Twist Straps

Twist straps provide a tension connection between two wood members. They resist uplift at the heel of a truss economically. LTS/MTS have a 2"-bend section and HTS has a 3¼"-bend section that eliminates interference at the transition points between the two members.

Material: LTS — 18 gauge; MTS — 16 gauge; HTS — 14 gauge

Finish: Galvanized. Some products available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners, with half into each member being connected, to achieve the listed loads; see General Notes.
- LTS, MTS and HTS are available with the bend reversed. Specify "-REV" after the model number, such as MTS16-REV.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

These products are available with additional corrosion protection. For more information, see p. 16.

For stainless-steel fasteners, see p. 23.

Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

MTS Installation as a Truss-to-Top Plate Tie

Typical MTS30 Installation

MTS30 Installation with I-Joist Rafter

- See pp. 276–277 for Straps and Ties General Notes.
- All LTS, MTS and HTS models (except for MTS12 and HTS16) have additional nail holes.
- All straps except the MTS30 and HTS30 have the twist in the center of the strap.
- Twist straps do not need to be wrapped over the truss to achieve the allowable load.
- May be installed on the inside face of the stud.
- Allowable lateral loads are $F_1 = 75$ lb. and $F_2 = 125$ lb. when the following installation requirements are met. The first seven nail holes on each side of the bend must be filled with 0.148" x 1½" minimum nails. All additional fasteners may be installed in any remaining strap holes.
- For simultaneous loads in more than one direction, the connector must be evaluated using either the Unity Equation or the 75% Rule, as described in Straps and Ties General Notes on p. 277.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.
- Using Strong-Drive® SD Connector (SD9112) screws for 0.148" x 1½" and 0.148" x 3" nails will get the same loads as using nails.

LTP4/LTP5/A34/A35

Framing Angles and Plates

The larger LTP5 spans subfloor at the top of the blocking or rim board. The embossments enhance performance.

The LTP4 lateral tie plate transfers shear forces for top plate-to-rim board or blocking connections. Nail holes are spaced to prevent wood splitting for single and double top-plate applications. May be installed over plywood sheathing.

The A35 angle's exclusive bending slot allows instant, accurate field bends for all two- and three-way ties. Balanced, completely reversible design permits the A35 to secure a great variety of connections.

Material: LTP4/LTP5 — 20 gauge; all others — 18 gauge

Finish: Galvanized. Some products available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes
- A35 — Bend one time only

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

Visit app.strongtie.com/rws to access our Roof-to-Wall Selector web application.

1. Allowable loads are for one angle. When angles are installed on each side of the joist, the minimum joist thickness is 3".
2. Some illustrations show connections that could cause cross-grain tension or bending of the wood during loading if not reinforced sufficiently. In this case, mechanical reinforcement should be considered.
3. LTP4 can be installed over 3/8" wood structural panel sheathing with 0.131" x 1 1/2" nails and achieve 0.72 of the listed load, or over 1/2" sheathing and achieve 0.64 of the listed load. 0.131" x 2 1/2" nails will achieve 100% load.
4. LTP4 satisfies the IRC® continuously sheathed portal frame (CS-PF) framing anchor requirements when installed over raised wood floor framing per Figure R602.10.6.4.
5. The LTP5 may be installed over wood structural panel sheathing up to 1/2" thick using 0.131" x 1 1/2" nails with no reduction in load.
6. Connectors are required on both sides to achieve F₂ loads in both directions.
7. A34 and A35 installed with 0.131" x 1 1/2" nails onto 1 1/4" LSL material will achieve 0.90 of the listed F₁ and F₂ loads.
8. **Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. PH612I is a pan-head #6 x 1 1/2" screw available from Simpson Strong-Tie. See pp. 23–24 for other nail sizes and information.

LTP4 attaching Top Plates to Rim Board

Chimney Framing

RBC/RBCP™

Roof Boundary Clip

The RBC roof boundary clip is designed to aid installation and transfer shear loads between the roof diaphragm and wall. The locator tabs make proper location of the clip easy. The RBC can be used on wood or masonry walls and will handle roof pitches from 0/12 to 12/12. The RBC is available with prongs into one side (RBCP) for pre-attachment of the part to a block at the truss plant.

Material: 20 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes
- Field bend to desired angle — one time only
- RBCP should be pressed on to blocking, not hammered

Codes: See p. 13 for Code Reference Key Chart

The RBC installed to blocking resists rotation and lateral displacement of rafter or truss.

Code references:

- IRC® 2012/2015/2018/2021, R802.8 Lateral Support
- IBC® 2012, 2308.10.6; 2015/2018/2021, 2308.7.8 Blocking

Blocking allows proper edge nailing of sheathing.

RBC RBCP	1	45° to 90°	(6) 0.148 x 1 1/2	(6) 0.148 x 1 1/2	445	380	IBC, FL, LA
	2	< 30°	(6) 0.148 x 1 1/2	(6) 0.148 x 1 1/2	435	375	
		30° to 45°	(6) 0.148 x 1 1/2	(6) 0.148 x 1 1/2	465	400	
	3	0° to 45°	(3) 1/4 x 2 1/4 Titen Turbo™ ⁴	(6) 0.148 x 1 1/2	350	350	—

1. See pp. 276–277 for Straps and Ties General Notes.
2. Allowable loads are for one anchor attached to blocking a minimum of 1 1/2" thick.
3. RBC/RBCP can be installed with up to a 3/4" gap and achieve 100% of the listed load.
4. When attaching to concrete, use three 1/4" x 1 3/4" TNT25134H Titen Turbo™ screw anchors.
5. RBC/RBCP installed over 1" foam board has a load of 395 lb. (160) in a parallel-to-wall (F1) load direction for Douglas fir. For SPF, the load is 340 lb.
6. RBC/RBCP may be installed over 1/2" structural sheathing using 0.148" x 1 1/2" nails with no load reduction.
7. **Fasteners:** Nail dimensions are diameter by length. Titen Turbo screws are Simpson Strong-Tie concrete and masonry screws. See pp. 23–24 for fastener information.

HSLQ™

Heavy Shear Transfer Angle

The HSLQ heavy shear transfer angle is designed to transfer lateral loads from wood solid sawn joists or blocking into a wood solid sawn element such as a moment frame nailer. The angle offers versatility by allowing up to a 2" gap between the structural members and easy installation with Strong-Drive® SDS Heavy-Duty Connector screws that are included with the HSLQ. The HSLQ is manufactured with a gap indication notch to make proper installation easy.

Material: 12 gauge

Finish: Galvanized, available in HDG

Installation:

- Use all specified fasteners: see General Notes.
- Use long leg with notch indicator.
(Notch indicates maximum allowed gap.)
- Minimum 4x8 wood members are required.
- Add filler shims where required in order not to load the angle in any direction other than lateral, as indicated.

Codes: See p. 13 for Code Reference Key Chart

HSLQ412-SDS2.5	1" – 2"	4¼		11¾	18	2,290	1,970	

1. Tables loads are for one angle.
2. Loads are applicable to installation on either the narrow or the wide face of the member.
3. Minimum 4x8 wood members are required.
4. HSLQ is used for in-plane lateral load transfer only. Designer to provide for frame out-of-plane stability as required.
5. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws.
See pp. 23–24 for fastener information.

Typical HSLQ37 Installation

Typical HSLQ412 Installation

L/LS/GA

Reinforcing and Skewable Angles

L — Staggered nail pattern reduces the possibility for splitting.

LS — Field-adjustable 0° to 135° angles.

GA — Gusset angles' embossed bend section provides added strength.

Material: L — 16 gauge; GA and LS — 18 gauge

Finish: Galvanized. Some products available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes
- LS — Field skewable; bend one time only
- Joist must be constrained against rotation (for example, with solid blocking) when using a single LS per connection
- Nail the L angle's wider leg into the joist to ensure table loads and allow correct nailing

Codes: See p. 13 for Code Reference Key Chart

1. GA angles may be installed with 0.148" x 3" nails.

2. GA1 uplift is 425 lb. for DF and 300 lb. for SPF when installed with Strong-Drive SD Connector screws.

3. GA2 uplift is 370 lb. for DF and 260 lb. for SPF when installed with Strong-Drive SD Connector screws.

4. Connectors are required on both sides to achieve F₂ loads in both directions.

5. **Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws.

See pp. 23–24 for fastener information.

6. Using Strong-Drive SD Connector screw (SD9112) for 0.148" x 1 1/2" and 0.148" x 3" nails will get the same load as nails.

A

Angle

Our line of angles provides a way to make a wide range of 90° connections.

Material: A21 and A23 — 18 gauge;
all other A angles — 12 gauge

Finish: Galvanized. Some products available in stainless steel or ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes

Codes: See p. 13 for Code Reference Key Chart

A44 Installation

1. See pp. 276–277 for Straps and Ties General Notes.
2. For SPF/HF lumber, use 0.86 x DF/SP allowable loads.
3. Connectors are required on both sides to achieve F₁ loads in both directions.
4. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.
5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

A311 Installation

A24 Installation

HL

Heavy Angle and Gusset

Versatile angle gussets and heavy angles promote standardization and construction economy, and are compatible with Simpson Strong-Tie structural hardware.

Finish: 7 gauge models — galvanized;

3 gauge models — Simpson Strong-Tie gray paint.

May be ordered HDG or black powder coat (add HDG or PC to model no.).

Options:

- Gussets may be added to HL models when $L \geq 5"$ (specify G after model number, as in HL46G).

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

Model No.	Ga.	Dimensions (in.)							Bolts (Total)		DF/SP Allowable Loads		Code Ref.	
		W ₁ and W ₂	L	D ₁	D ₂	D ₃	D ₄	Qty.	Dia.	Uplift (160)	F ₁ (160)

HL79	3	7¼	9	1½	3	2¾	3	12	¾	2,445	4,310			

- See pp. 276–277 for Straps and Ties General Notes.
- For SPF/HF lumber, use 0.85 x DF/SP allowable loads.
- Parts should be centered on the face of the member, which is at least as wide as the angle, to which they are attached.
- Wood members for the “3” and “5” series must have a minimum thickness of 3 1/2” for table loads to apply.
- Wood members for the “4” and “7” series must have a minimum thickness of 5 1/8” for table loads to apply.
- Allowable loads are for a single connector. Uplift loads may be doubled when using two connectors. Connectors are required on both sides to achieve lateral loads in both directions. Lateral loads may not be doubled.
- Lag screws of equal diameter (minimum 5” long) may be substituted for bolts in the beam with no reduction in load.
- All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

Z

Clip

The Z clip secures 2x4 flat blocking between joists or trusses to support sheathing.

Material: See table

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Z clips do not provide lateral stability. Do not walk on stiffeners or apply load until diaphragm is installed and nailed to stiffeners.

Codes: See p. 13 for Code Reference Key Chart

Model No.	Ga.	Dimensions (in.)				Fasteners ¹ (Total) (in.)	DF/SP Allowable Download (100/115/125/160)	Code Ref.
		W	H	B	TF

Z4	12	1 1/2	3 1/2	2 3/8	1 3/4	(2) 0.162 x 3 1/2	420	
Z28	28	2 5/8	1 1/2	1 3/8	1 3/8	0.148 x 1 1/2 ¹	—	—
Z38	28	2 5/8	2 1/2	1 3/8	1 3/8	0.148 x 1 1/2 ¹	—	
Z44	12	2 1/2	3 1/2	2	1 3/8	(4) 0.162 x 3 1/2	775	IBC, FL, LA

- Z28 and Z38 do not have nail holes. Fastener quantity and type shall be per designer.
- Z4 loads apply with a nail in the top and a nail in the seat.
- For SPF/HF lumber, use 0.86 x DF/SP allowable loads.
- Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical Z2 Installation

Kneewall Connectors

This product is preferable to similar connectors because of (a) easier installation, (b) higher loads, (c) lower installed cost, or a combination of these features.

The Simpson Strong-Tie RCKW rigid connectors have been developed to resist overturning moment at the base of exterior kneewalls and parapets as well as interior partial-height walls. The RCKWS is a heavy 7-gauge stiffener that nests onto the RCKW clip. The screw holes and anchor holes in the stiffener line up with those in the RCKW clip, making fastener and anchor installation a snap. The RCKW clip and RCKWS stiffener are sold separately.

Features:

- Anchorage legs incorporate stiffened flanges, improving overturning moment resistance
- Large-diameter anchor hole accommodates ½"-diameter concrete screws and wedge anchors, such as the Titen HD® heavy-duty screw anchor and the Strong-Bolt® 2 wedge anchor
- For the RCKWS: 7-gauge stiffeners are secured to the RCKW clip with screws, optimizing overturning moment resistance and stiffness

Material: RCKW and RCKWS — 7 gauge

Coating: Galvanized

Installation:

- Use all specified screw fasteners.
- When using the RCKWS, secure the stiffener to the clip with the specified screw fasteners.
- Use all specified anchors. To achieve tabulated stiffness values, the installation torque for ½"-diameter anchors shall be at least 17 ft.-lb.
- For installation of the RCKW with 2x6 wood framing members, reference Simpson Strong-Tie engineering letter L-C-RCKW2X6WD at strongtie.com.

Codes: See p. 13 for Code Reference Key Chart

RCKW Allowable Loads for Wood Framing

Model No.	Screw Pattern No.	Fastener(s) to Post and Concrete	Nominal Post Size	Allowable Moment, M _{DF/SP} (in.-lb.)	Anchor Tension, T, at Allow Moment, M (lb.)	Assembly Rotational Stiffness β (in.-lb./rad.)	Connector Rotational Stiffness β _c (in.-lb./rad.)
RCKW3	1	(4) #10 x 2 1/2" SD (1) 1/2" Ø Anchor	(2) 2x4 or 4x4	2,165	1,695	102,800	111,300
RCKW3 RCKW3S	2	(9) #10 x 2 1/2" SD (1) 1/2" Ø Anchor	(2) 2x4 or 4x4	3,725	3,635		

1. Designer is responsible for anchorage and framing member design.
2. Tabulated values are based on wood post connected to sill plate in accordance with the fastening schedule IBC® Section 2304.
3. Multiply allowable moment and stiffness with an adjustment factor of 0.86 when attaching RCKW connector to SPF/HF wood post.
4. Anchor Tension, T, is the force in the anchor at allowable moment and is based on minimum concrete compressive strength, f'_c of 2500 psi.
5. Tabulated Allowable Moment values correspond to connector strength without consideration of serviceability. Designer must check out-of-plane deflections using tabulated rotational stiffness values.
6. Tabulated Assembly Rotational Stiffness is applicable for studs up to 38" tall and includes connector deflection, fastener slip and bending in the stud. For framing members greater than 38" tall, the designer must consider member deflection due to bending in the stud member in addition to the tabulated Connector Rotational Stiffness. See flier F-CF-RCKW at strongtie.com for calculation example.
7. Tabulated rotational stiffness values may be increased by dividing by a factor of 0.42 for deflection checks using component and cladding wind loads in lieu of reducing loads in accordance with 2012, 2015, 2018 and 2021 IBC Table 1604.3.
8. Built-up post (multiple members) must be fastened together to act as one unit to resist the applied load (excluding the connector fasteners). This must be determined by the designer.
9. Anchor bolt nut should be finger tight plus 1/4 to 1/2 turn with a hand wrench, with consideration given to possible wood shrinkage. Moisture content of wood sill plate shall not exceed 19% at time of installation.
10. **Fasteners:** SD screws are Simpson Strong-Tie Strong-Drive® SD Connector screws. See pp. 23–24 for fastener information.

FB/FBR/FBFZ™

Fence Rail Brackets

FB and FBR fence brackets make the connection between fence rails and posts simple and strong. Eliminates the need for toe nails or screws. Clean, versatile connections make planning and building fences, deck/porch railings and louvers easier and faster.

The patent-pending FBFZ flat rail bracket offers a more concealed install look. In addition to fence-rail connections, the FBFZ can also be used for handrail attachments for porch and deck railings that are 30" or closer to ground level.

Material: See table

Finish: FB/FBFZ/FBR — galvanized; FB24SS — stainless steel. Some products available in ZMAX® coating.

Installation:

- FB/FBFZ — Install using 0.131" x 1½" nails or #9 x 1½" Strong-Drive® SD Connector screws.
- FB24R/FB24Z/FB24SS — Install with three fasteners into the rail and two fasteners into the supporting member.
- FB26 — Install with three fasteners into both the rail and the supporting member.
- FBR24Z — Sized for 0.148" x 1½" nails or #9 x 1½" Strong-Drive SD Connector screws. Install with three fasteners into the rail and two fasteners into the supporting member.
- For FBFZ installation, position the bracket on the end of the 2x4 rail. Install fasteners into all three holes. Slide the rail into place against the post or other wood supporting member. Install one fastener through both the top and bottom holes into the supporting member.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/fps to access our Fence Planner Software™.

These products are available with additional corrosion protection. For more information, see p. 16.

SD Many of these products are approved for installation with Strong-Drive SD Connector screws. See pp. 362–366 for more information.

	Model No.	Ga.	Member Size	Dimensions (in.)			Code Ref.

PGT®

Pipe Grip Ties®

Our popular PGT pipe grip tie series now includes more models to meet a variety of conditions for attaching wood fence rails to metal fence posts and eliminating rotted and failed wood posts. PGT is suitable for standard applications as well as corners and splices.

- PGTIC2Z-R is an interior corner pipe grip tie.
- PGT1.5Z-R is for 1½" pipe (1⅞" outside diameter).
PGT2-R and PGT2Z-R are for 2" pipe (2⅜" outside diameter).
- PGT2A is for 2" pipe (2⅜" outside diameter).
- PGT2E is for 2" pipes and features a two-piece design that provides a solid connection between fence stringer and post.

Material: PGT2A — 14 gauge; all others — 12 gauge

Finish: PGTA, PGT2-R, PGT2E — galvanized;
PGTIC2Z, PGT1.5Z, PGT2Z-R — ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes.
- PGTIC2Z-R to Post — Install two set screws (supplied) with ⅜" socket in predrilled holes.
- PGTIC2Z-R to Rails — Use ¼" x 1½" Strong-Drive® SDS Heavy-Duty Connector screws (not supplied). PGTIC set screws are included.
- Install on vertical pipes, offsetting corners to allow for the correct rail alignment.
- Use three to four PGTs per pipe; line up to stringline.
- Fasten PGT with ¼" hex-head bolt (supplied).
- PGT attaches to rails with four ¼" x 1½" Strong-Drive SDS Heavy-Duty Connector screws (not supplied). See p. 361 for Strong-Drive SDS Heavy-Duty Connector screw information. ¼" lag screws may be used. Follow the code requirements for predrilling.
- Field bend PGT flanges to fit corner and angled conditions (bend one time only).
- Nail or screw fence boards to rails.
- PGT2E-R50: Sold as full carton with (50) attachment plates, (50) front straps and (55) ¼" diameter x ¾" long hex-head bolts.
- PGTSCREW-R10 is a pack of (10) ¼" x 2½" replacement hex-head screw bolts for the PGT2A, PGT2-R, PGT2Z-R and PGT1.5Z-R.

Web Applications: Visit app.strongtie.com/fps to access our Fence Planner Software™.

These products are available with additional corrosion protection. For more information, see p. 16.

DPTZ

Deck Post Tie

The DPTZ deck post tie products are used to attach 2x4 (DPT5Z) or 4x4 (DPT7Z) vertical posts to the side of stringers, rims or other wood members.

Material: 14 gauge

Finish: ZMAX® coating

Installation:

- Use specified HDG fasteners; see General Notes
- Typically installed in pairs
- Install with two 3/8" through bolts into side member (lag screws not permitted) and (5) 0.148" x 1 1/2" nails to post for DPT5Z or (5) 0.148" x 3" for DPT7Z

Web Applications:

Visit app.strongtie.com/fps to access our Fence Planner Software™.

DPT7Z

Stairway Installation
(DPT5Z similar)

Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

LSC

Adjustable Stringer Connector

The LSC adjustable stair-stringer connector offers a versatile, concealed connection between the stair stringer and the carrying header or rim board while replacing costly framing. Field slopeable to all common stair stringer pitches, the LSC connector is suitable for either solid or notched stringers.

Features:

- Replaces additional framing and toe-nailing.
- May be installed flush with the top of the carrying member (typically suitable for 2x10 or 2x12 header / rim board) or lower on the face (typically suitable for a 2x12 header / rim board).
- Interchangeable for left or right applications.
- LSCZ features a ZMAX® coating for additional corrosion protection. Suitable for interior and some exterior applications. LSCSS is made from stainless steel for higher exposure environment. See strongtie.com/info for more information.

Material: 18 gauge

Finish: LSCZ — ZMAX coating; LSCSS — stainless steel

Installation:

- Use all specified fasteners, see table.
- Before fastening, position the stair stringer with the LSC on the carrying member to verify where the bend should be located.
- The fastener that is installed into the bottom edge of the stringer must go into the second-to-last hole.
- When installed on 1 $\frac{5}{16}$ " LVL or a 1 $\frac{1}{4}$ " LSL stringer, additional items that will not affect the structural performance of the LSC, but should be considered, include the following:
 - LSC stringer flange will protrude $\frac{1}{4}$ " from face of stringer. As such, it is recommended the LSC be installed with the tabs positioned to the outside of the stringer.
 - 1 $\frac{1}{2}$ " fasteners installed into 1 $\frac{1}{4}$ " LSL stringer will protrude from the opposite side.

Codes: See p. 13 for Code Reference Key Chart

	Cantilever	(8) #9 x 1 1/2" SD	(8) #9 x 1 1/2" SD	—	545	545	445	445	

1. When installed on minimum 1 5/8" LVL or minimum 1 1/4" LSL stringers, allowable loads for DF/SP shall apply.
2. When cross-grain bending or cross-grain tension cannot be avoided in the members, mechanical reinforcement to resist such forces shall be considered by the designer.
3. #9 x 1 1/2" Strong-Drive SD Connector screws may be substituted for 0.148" x 1 1/2" nails to achieve published nail values if the extra screw is installed in the narrow face of the stringer.
4. When LSC is installed at end of rim board over support framing, use standard load.
5. **Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

Supported LSC Installation

DJT14Z

Deck Joist Tie

The DJT14Z deck joist tie is designed to attach 2x deck joists to the side of 4x or larger support posts. The DJT14Z can be installed with either nails or bolts.

Material: 14 gauge

Finish: ZMAX® coating

Installation:

- Use specified HDG fasteners; see General Notes
- Recommended: install on post first
- Minimum 2x4 joist and 4x4 post

Codes: See p. 13 for Code Reference Key Chart

Typical DJT14Z Installation

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Model No.	Fasteners (in.)			Allowable Loads				Code Ref.
	Nails	Bolts		Nails		Bolts		
		Qty.	Dia.	Floor (100)	Roof (125)	Floor (100)	Roof (125)	
SS DJT14Z	(8) 0.162 x 3½	2	⅝	1,160	1,320	1,325	1,325	IBC®, FL, LA

1. Loads are for one DJT14Z.

2. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.

3. Install bolts or nails as specified by designer. Bolt and nail values may not be combined.

4. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

TA

Staircase Angle

For use in structurally sound staircase framing. The TA eliminates costly conventional notching.

Material: 12 gauge

Finish: TA9Z/TA10Z — ZMAX coating;
TA9SS/TA10SS — stainless steel.

Order: May be ordered as kits with model numbers TA9ZKT and TA10ZKT. Each kit includes two ZMAX TAs and 1/4" x 1 1/2" Strong-Drive SDS Heavy-Duty Connector screws.

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

Model No.	Fasteners		DF/SP Allowable Downloads (100)	Code Ref.
	Stringer	Tread		
SS TA9Z	(2) 1/4" x 1 1/2" SDS	(3) 1/4" x 1 1/2" SDS	500	—
	(3) 1/4" x 1 1/2" SDS	(2) 1/4" x 1 1/2" SDS	750	
SS TA10Z	(3) 1/4" x 1 1/2" SDS	(4) 1/4" x 1 1/2" SDS	750	
SS TA10Z	(4) 1/4" x 1 1/2" SDS	(3) 1/4" x 1 1/2" SDS	1,000	

1. Loads may be adjusted for other durations according to the code.

2. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Typical TA9Z Installation
(install at each end of stair tread)

Alternate Installation of TA10Z
Inverted for Double 2x6 Treads

ML

Angle

The ML angle combines strength and versatility through the use of Strong-Drive® SDS Heavy-Duty Connector screws. Fastener holes are staggered to minimize wood splitting and opposing hole pattern allows for back-to-back installation without fastener interference.

Material: 12 gauge

Finish: MLZ — ZMAX® coating; MLSS — stainless steel.

Installation:

- Use all specified fasteners; see General Notes
- ¼" x 1½" Strong-Drive SDS Heavy-Duty Connector screws are not provided with the angle
- Use stainless-steel fasteners with stainless connectors

Codes: See p. 13 for Code Reference Key Chart

KBS1Z™

Knee-Brace Stabilizer

The KBS1Z knee-brace stabilizer makes a structural connection between knee bracing and columns or beams to help stabilize free-standing structures and comply with many prescriptive deck bracing requirements such as AWC's DCA6 Prescriptive Residential Wood Deck Construction Guide. Factory-formed at a 45° angle and easily installed with nails, the KBS1Z braces 2x, 4x and 6x in line post-to-beam configurations. Check with your local building department for deck bracing requirements.

Material: 16 gauge

Finish: ZMAX® coating

Installation:

- Use all specified fasteners; see General Notes.
- For installations at an angle other than 45°, bend KBS1Z along slots to desired angle. Bend one time only.
- **Knee Brace:**
 - Cut braces at desired angle
 - Bend KBS1Z to desired angle if required
 - Install fasteners to secure in place
 - For equal-width members, install (2) KBS1Z on each end of brace (see illustration 1 on p. 313)
 - For 2x knee brace, install single KBS1Z on each end of brace (see illustration 2 on p. 313)
- **Alternate Post Cap Application:**
 - Install in pairs; see illustrations 3 or 4 for quantity and configuration
 - Part used as a column cap; does not replace a knee brace

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/dps to access our Deck Planner Software™.

KBS1Z

US Patent 9,045,895

These products are available with additional corrosion protection. For more information, see p. 16.

Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Beam End

DTT™

Deck Tension Ties

DTT tension ties are safe, cost-effective connectors designed to meet or exceed code requirements for deck construction. These versatile DTT connectors are also load-rated as a holdown for light-duty shearwalls and braced-wall panel applications.

For new construction or to make an existing deck code-compliant, the DTT1Z can be used as a tension-tie to satisfy the 2015, 2018 and 2021 IRC® provision for a 750 lb. lateral load connection to the house at four locations per deck. This code detail permits the lateral connection from the deck joists to be made to top plates, studs or headers within the supporting structure, which eliminates the need to access to the floor joists inside the home. The DTT1Z is available in a kit (DTT1Z-KT) that includes four DTT1Z connectors, four Strong-Drive® SDWH™ Timber-Hex HDG screws (SDWH27800G) and (26) #9 x 1½" Strong-Drive SD Connector screws.

The DTT1Z fastens to the narrow or wide face of a single 2x with Strong-Drive SD Connector screws or nails and accepts a ¾" bolt, anchor bolt or lag screw (washer required) or can be installed with the Strong-Drive SDWH Timber-Hex HDG screw with an integral washer.

The DTT2 can be used to satisfy the IRC provision for a 1,500 lb. lateral load connection at two locations per deck. Additionally, the DTT2 has been tested and evaluated in deck guardrail post applications to resist the code-specified lateral forces at the top of railing assemblies. The DTT2 is also available with longer 2½" Strong-Drive SDS Heavy-Duty Connector screws (model DTT2Z-SDS2.5) to achieve higher loads when needed. The DTT2 fastens easily to the wide face of a single or double 2x using Strong-Drive SDS Heavy-Duty Connector screws (included) and accepts a ½"-diameter bolt or anchor bolt.

For guard post installations using Strong-Drive SDWS™ Timber screws, see technical bulletin T-F-GRDPSTR at strongtie.com.

Material: 14 gauge

Finish: DTT1Z/DTT2Z — ZMAX® coating;
DTT2SS — stainless steel

Installation:

- Use all specified fasteners; see General Notes.
- A standard cut washer (included for DTT2) must be installed between the nut and the seat.
- DTT1Z can only be used when floor joists are parallel to deck joists. See technical bulletin, T-C-DECKLAT (Condition 7), at strongtie.com.
- Strong-Drive SDS Heavy-Duty Connector screws (SDS) install best with a low-speed high-torque drill with a ¾" hex-head driver (Model BITHEXR38-R1).
- Strong-Drive SD Connector screws (SD) install with a ¼" hex-head driver.
- Strong-Drive SDWH Timber-Hex HDG screws install with a ¾" hex-head driver (Model BITHEXR38-R1).

Codes: See p. 13 for Code Reference Key Chart

				3	2,145	1,835	
DTT2Z-SDS2.5	1 ⅜ ₁₆	½	(8) ¼ x 2 ½ SDS	3	2,145	2,105	

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. DTT1Z installations with allowable loads below 750 lb. do not satisfy the 2015/2018/2021 IRC requirements for deck-to-house lateral load connections.
3. The Strong-Drive SDWH™ Timber-Hex HDG screw with a minimum of 3" thread penetration into dry lumber has an allowable withdrawal load (160) of 1,380 lb. into SP, 1225 lb. into DF, and 1,020 lb. into SPF/HF.
4. Load values are valid if the product is flush with the end of the framing member or installed away from the end.
5. The guardrail post illustration above addresses an outward force on the guardrail. An additional DTT2 can be added at the lower bolt to address an inward force.
6. A ⅝" HDG round washer is required with the use of a lag screw.
7. **Fasteners:** Nail dimensions are listed diameter by length. SD and SDS screws are Simpson Strong-Tie Strong-Drive screws. See pp. 23–24 for fastener information.

see technical bulletin T-C-GRDRLPST at strongtie.com

Brick Veneer Ledger Connector

The BVLZ brick veneer ledger connector provides a new code-compliant, tested solution for safely adding a deck to an existing house with brick veneer exterior. It attaches a wood ledger to the framing through the veneer. This patent-pending connector kit provides a viable alternative to building a free standing deck, and it installs without having to remove or replace large sections of brick veneer.

The BVLZ brick veneer ledger connector kit includes a steel ledger plate, a compression strut, two 14" Strong-Drive® SDWH™ Timber-Hex HDG tension screws and six Strong-Drive SD Connector shear screws. An installation template is provided with the four-part kit. The BVLZ connector is designed so the two tension screws pass through the vertical mortar into the structural framing, and the compression strut transfers compression forces from the ledger plate to the rim joist. The system enables the ledger to hang freely without bearing on the brick veneer.

Features:

- Allows for drilling through the mortar joints
- Enables inspection/approval by building departments in a retrofit construction application
- Accommodates a wide range of air gaps and brick sizes
- Minimizes penetrations through existing exterior water barriers
- Available as a single-part kit (BVLZ-KT1) or a four-part kit (BVLZ-KT4).

Material: 12 gauge

Finish: ZMAX®

Installation:

- Use all specified fasteners. All fasteners supplied with connector.
- Complete installation instructions provided with each kit.
- Installation video available on strongtie.com/bvlz.
- Measure where each ledger plate will be positioned on the veneer.
- At first location, align the center hole of installation guide with the mortar joint in the brick veneer. Drill through the center hole using a hammer drill and a 1 1/8" masonry drill bit.
- Drill two 40° upward-angled holes using the guide and 1 1/8"-diameter drill bit. Repeat for each plate location.
- Mark the placement of each plate on the ledger board. Using installation guide, drill 1 1/8"-diameter hole horizontally through the center hole and mark the two angled-hole locations. Then drill two 1 1/8"-diameter angled holes at each marked location on the ledger.
- Thread the compression strut into the back of the ledger plate to the end of the threads. Install the left-most and right-most plates on the ledger and attach each with six Strong-Drive SD Connector screws (provided).
- Place the ledger board against the brick veneer and install two 14" Strong-Drive SDWH Timber-Hex HDG screws in each of the plates. Push downward on the drill while driving to ensure the screws are snug against the gusset channel and maintain a 40° angle while screwing into dry, 1 1/2"-wide minimum rim.
- Rotate compression struts with pliers until they bear tightly against the framing. Install the remaining BVLZ connectors along the length of the ledger.

Codes: See p. 13 for Code Reference Key Chart

Web Applications: Visit app.strongtie.com/dps to access our Deck Planner Software™.

Typical BVLZ Installation

Visit strongtie.com/bvlz for more information and to watch an installation video.

Brick Veneer Ledger Connector (cont.)

Model No.	Fasteners		Rim		Allowable Downloads (100/115)		Code Ref.
	Rim	Ledger	Size	Species	Compression Strut Bearing Surface		
					Rim Board	WSP	
BVLZ	(2) SDWH271400G	(6) #9 x 1 ½" SD	2x	DF	505	410	IBC®, FL, LA
				SP	455		
				SPF/HF	345		

1. Rim board must be designed to receive applied moment equal to: (Gap) x (Applied Load)
2. When cross-grain bending or cross-grain tension cannot be avoided in the Rim, additional reinforcement to resist such forces shall be considered by the designer.
3. The BVLZ does not replace the need for lateral load resistance per 2018/2021 IRC Section R507.9.2.
4. Wet service factor has been applied to BVLZ connection to deck ledger.
5. Weatherproof ledger as required by code.
6. 2x is 1 1/2" wide, minimum. Load values for sawn lumber are applicable to 1 1/2" wide structural composite lumber rim with equivalent specific gravity.
7. Wood Structural Panel (WSP) is OSB or plywood with a maximum thickness of 1 9/16".
8. For prescriptive spacing, visit strongtie.com/bvlz.
9. **Fasteners:** SD screws are Simpson Strong-Tie Strong-Drive® SD Connector screws. SDWH screws are Simpson Strong-Tie Strong-Drive Timber-Hex HDG screws. See pp. 23–24 for fastener information.

Visit strongtie.com/bvlz for more information and to watch an installation video.

E-Z Base™/E-Z Mender™/E-Z Spike™

Fence Products

Replacing an entire fence can be an expensive and difficult task. Simpson Strong-Tie offers a line of products designed to help make reinforcing fence posts easy and economical. The E-Z Base™, E-Z Mender™ and E-Z Spike™ offer simple solutions for all types of fence post projects.

E-Z Spike (Model No. FPBS44)

- Allows easy installation of 4x4 wood posts without digging holes or pouring concrete
- Can be used for a variety of applications where quick-to-install posts are needed

E-Z Mender (Model No. FPBM44E)

- Allows easy repair of rotted or damaged 4x4 wood posts installed in concrete or dirt
- Reinforces weakened wood posts without having to replace the post or the concrete
- Sold individually; use in pairs

E-Z Base (Model No. FPBB44)

- Allows easy installation of 4x4 wood posts on existing concrete

Material: 12 gauge

Finish: Black powder coat

Installation:

- See flier F-C-EZFPP at strongtie.com
- E-Z Spike: attach post with (4) 1/4" Strong-Drive® SDS Heavy-Duty Connector screws or (4) #10 x 1 1/2" SD Connector screws
- E-Z Base: attach with (8) #9 x 1 1/2" or #10 x 1 1/2" Strong-Drive SD Connector screws
- E-Z Mender: use (6) #9 x 1 1/2" or #10 x 1 1/2" Strong-Drive SD Connector screws per part
- Post bases do not provide adequate resistance to prevent rotation about the base and therefore are not recommended for non-top-supported installations such as fences or unbraced structures

Web Applications:

CTS™

Compression and Tension Strap

The CTS218 is designed to repair wood members such as top plates, studs and trusses, and it handles both tension and compression loads. The unique rolled edges of the strap allow it to span gaps as wide as 4½", and its 1½" width enables installation on the narrow face of 2x lumber.

- Tested specifically for top/bottom plate repair with various multi-strap configurations
- Meets the requirements of the IBC® and IRC® for repairing top plates that have been cut or notched to accommodate plumbing or HVAC ductwork

Material: 14 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- One-sided installations — install one or two CTS straps on the same side of the member.
- Two-sided installation — install CTS straps on opposite sides of member. For three-part installations, install two parts on one side, one part on opposite side.

Codes: See p. 13 for Code Reference Key Chart

- IBC – 2012 2308.9.8; 2015/2018/2021 2308.5.8

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Fastener quantities are for a single strap.
3. Maximum gap between wood members is 4½".
4. **Fasteners:** Nail dimensions are listed diameter by length. SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

Single CTS218 and PSPN58 Installation

Double CTS218 and PSPN58 Installation

NS/PSPNZ

Nail Stoppers

Nail stoppers help prevent nails from piercing pipes and electrical lines. Installed over utilities that pass through framing members.

PSPN516Z and PSPN58Z protecting shield plate nail stoppers meet IRC®, IBC® and the International Plumbing Code. PSPN516Z meets structural and protection requirements with one strap.

Material: NS — 14 gauge; PSPN — 16 gauge

Finish: Galvanized; PSPN — ZMAX® coating.

Installation:

- PSPN516Z — 0.162" x 3½" nails (see footnote 2 below)
- Other models — 0.131" x 2½" nails or prongs
- For more information refer to flier F-C-REPAIRPRO at strongtie.com

Codes: See p. 13 for Code Reference Key Chart

PSPN516Z at top plates

- International Residential Code® — 2015/2018/2021 P2603.2.1, R602.6.1 and M1308.2
- International Building Code® — 2015/2018/2021 2308.5.8

These products are available with additional corrosion protection. For more information, see p. 16.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Model No.	W (in.)	L (in.)	Fasteners (Total)	DF/SP Allowable Tension Load	Allowable Tension Load SPF/HF	Code Ref.
			Nails (in.)	(160)	(160)	
PSPN58Z	5	8	—	—	—	PR
PSPN516Z	5	16⅞	(12) 0.162 x 3½	1,320	1,145	
			(16) 0.162 x 3½	1,760	1,530	
			(24) 0.162 x 3½	2,640	2,290	

1. PSPN516Z sill plate installation requires (12) 0.162" x 3½" nails. Double top plate installation requires (16) or (24) 0.162" x 3½" nails.
2. To meet the prescriptive IBC requirement, 0.135" dia. x 3½" long nails may be used. Allowable tension load is 0.75 of table loads when installed with 0.135" dia. x 3½" nails. To meet the 2012–2021 IRC prescriptive requirement, 0.148" dia. x 1½" long nails may be used.

Model No.	W (in.)	L (in.)	Code Ref.
NS1	1½	3	PR
NS2	1½	6	

RPS

Strap Ties

The RPS meets IBC®, IRC® and City of Los Angeles code requirements for HVAC and pipes in walls.

Finish: Galvanized. Some products available in ZMAX® coating.

Installation:

- Use all specified fasteners; see General Notes
- Use RPS22 or RPS28 (16 gauge) to reinforce top plate
- Use RPS18Z, RPS22Z or RPS28Z (16-gauge ZMAX) to reinforce sill plate

Codes: See p. 13 for Code Reference Key Chart

- International Residential Code® — 2012/2015/2018/2021 R602.6.1
- International Building Code® — 2012 2308.9.8; 2015/2018/2021 2308.5.8

RPS

Typical RPS Installation
(only one strap may be necessary to meet IRC requirements)

These products are available with additional corrosion protection. For more information, see p. 16.

	Model No.	Ga.	Dimensions (in.)		Notch Width (in.)	Fasteners (Total)	DF/SP Allowable Tension Loads	SPF/HF Allowable Tension Loads	Code Ref.
			W	L			Nails (in.)	(160)	
■	RPS18	16	1 ½	18⅝	≤ 5 ½	(12) 0.162 x 2 ½	1,345	1,165	IBC, FL, LA
■	RPS22		1 ½	22⅝	≤ 5 ½	(12) 0.162 x 2 ½	1,345	1,165	
			1 ½	22⅝		(16) 0.162 x 2 ½	1,790	1,550	
■	RPS28		1 ½	28⅝	≤ 12	(12) 0.162 x 2 ½	1,345	1,165	
			1 ½	28⅝		(16) 0.162 x 2 ½	1,600	1,550	

1. Loads have been increased for wind or earthquake loading, with no further increase allowed. Reduce where other loads govern.
2. To meet the prescriptive IRC requirement, 0.148" x 1 1/2" nails may be used.
3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

HSS/SS

Stud Shoes

Stud shoes reinforce studs notched in construction. They are not a total replacement of removed material. Installs over pipe up to 2 $\frac{3}{8}$ " outside diameter.

HSS stud shoes provide tension load capacity as well as increased compression loads. Flared flange provides greater strength.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; see General Notes.
- HSS — Bend flanges at 90° angle during installation, then bend back and screw into position (screws included). Bend flanges one cycle only.

Codes: See p. 13 for Code Reference Key Chart

- International Residential Code® — 2012/2015/2018/2021 R602.6 and P2603.2.1
- International Building Code® — 2012 2308.9.10 and 2308.9.11; 2015/2018/2021 2308.5.9 and 2308.5.10
- International Plumbing Code — 2012/2015/2018/2021 305.6

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

Model No.	Stud Size	W (in.)	Fasteners (in.)	Allowable Loads ¹			Code Ref.
				DF/SP			
				Compression		Tension	
				Floor (100)	Roof (125)

HSS2-3-SDS3	(3) 2x	4 ⁵ / ₁₆	(12) 1/4 x 3 SDS	990	990	960	
HSS4-SDS3	4x	3 ⁵ / ₁₆	(12) 1/4 x 3 SDS	1,205	1,205	1,025	

1. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
2. **Fasteners:** Nail dimensions are listed diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

HSS

HSS2-3

SS

Step 1

Install HSS (HSS2-3 shown) over stud with flanges bent at a 90° angle.

Step 2

Bend HSS (HSS2-3 shown) flanges one time only. Screw into position.

Typical SS3 Installation

Typical SS1.5 Installation

WB/WBC/TWB/RCWB

Wall Bracing

Simpson Strong-Tie wall bracing products offer effective options to resist racking during construction. While these straps are not designed to replace a structural panel shearwall load-carrying component, the RCWB and WB/WBC may be used as a cost-effective and faster-installation alternative for the IRC® 1x4 let-in wall brace requirements.

The WBC (coiled WB) multiple product dispenser pack weighs less than 40 pounds, making storage and transportation easy. WB106C — 15 pieces per roll, WB126C — 12 pieces per roll, WB143C — 10 pieces per roll.

The RCWB features a rolled edge (the TWB has two rolled edges) for extra strength and safety.

Material: WB and WBC — 16 gauge; TWB — 22 gauge; RCWB — 20 gauge

Finish: TWB galvanized; all others galvanized

Installation:

- Use all specified fasteners; see General Notes.
- Install nails through the flat face of the TWB.

WB and WBC:

- Install in "X" pairs or in opposing "V" fashion.
- Use with 16" or 24" o.c. 2x4 (min.) studs.

RCWB and TWB:

- Use with 16" o.c. studs.
- Use minimum of 2x4 studs with TWB.
- Use minimum of 2x6 studs with RCWB (2x4 min. for interior, non-bearing wall).
- Establish a run-line using the bracing as a straight edge. Single cut a saw kerf $\frac{5}{8}$ " deep (TWB) or $1\frac{1}{8}$ " deep (RCWB) along the run line. If the wall is preframed on the floor, place the part into the saw kerf, and put one nail into the top plate. Tilt the wall up and plumb before nailing off top plate, bottom plate and studs according to the nailing schedule.

1. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

Typical RCWB Installation

NCA/TB/LTB

Bridging

NCA — Nailless installation eliminates callbacks for nail squeaks. Designed for secure grip before the drive-home blow, and deeper prong penetration. Precision-formed into a rigid “V” section.

TB — Tension-type bridging with maximum nailing flexibility. Use just two of the seven nail holes at each end.

LTB — Staggered nail pattern accommodates 2x8 and 2x10 joists. Use just two of the six nail holes at each end. LTB40 has rigid prongs that install easily into the joist, and embossments that allow crisp bends.

Material: LTB — 22 gauge; NCA and TB — 20 gauge
(except NCA2x12-16 — 18 gauge)

Finish: Galvanized

Installation:

- Support floor joists with a depth-to-thickness ratio of six or more with bridging at intervals not exceeding 8'. If span is greater than 8', install on 2x8 or larger joists. If span is greater than 16', use more than one pair.
- Tension bridging works only in tension, so must be used in cross pairs.
- Install bridging tightly; loose installation may allow floor movement.
- NCA may be installed before or after sheathing, from the top or bottom. Simply locate the bend line approximately 1" from the joist edge.
- NCA has nail holes in one end for use if a prong is bent during installation. Fully seat nails (0.131" x 1½") if they are used; otherwise, they may lead to squeaks.
- TB requires two 0.148" x 1½" fasteners per end.
- LTB requires two 0.113" x 2" nails per end.

Codes: See p. 13 for Code Reference Key Chart

Code Reference: IRC® 2012/2015/2018/2021 — R502.7.1, R802.8.1

Space bridging to avoid contact noises.

Install from below as shown, or from above. Drive upper end into joist approximately 1" from the top.

For all bridging avoid contact between steel members (this may cause squeaks).

Typical TB Installation

RTA/RTB/RTC/RTF/RTRZ/RTT/RTU/FWH

Rigid Tie® Connectors

Rigid Tie connector products are great utility connectors used to connect wood members together in a variety of ways. See the table and drawings for possible wood member connections.

Material: RTC44 — 14 gauge; RTA2 — 16 gauge; RTRZ and RTB — 20 gauge; all others — 18 gauge

Finish: Galvanized. Some products available in ZMAX® coating. Select models available in black powder coat; see strongtie.com for options.

Installation:

- Use all specified fasteners; see General Notes
- Always follow manufacturer's instructions when using power tools and building equipment

Codes: See p. 13 for Code Reference Key Chart

These products are available with additional corrosion protection. For more information, see p. 16.

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

**WBSK**

The Workbench/Shelving Kit is a fast-easy way to build a workbench and many other DIY-type projects that need a four-corner base. Visit strongtie.com/diy for more information.

SBV/CF-R

Shelf Brackets / Concrete Form Angles

Use the SBV for shelving, counter brackets window ledge supports, at a very competitive price.

The CF-R is used where a moderate-size shelf bracket and reinforcing angle is needed. When used for tilt-up perimeter forming, the nail hole placement ensures substantial reuse.

Material: 16 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners. See General Notes.
- SBV — Reversible for nominal 10" or 12" shelves of any thickness.
- CF-R (Retail Pack) — Recommended spacing is 36" on center for 2x's and 18" on center for 1x's. Use the 5" leg for 6" lumber and the 6" leg for 8" lumber. Holes are sized for ¼" Strong-Drive® SDS Heavy-Duty Connector screws, 0.148"-diameter nails or #9 Strong-Drive SD Connector screws.

Codes: See p. 13 for Code Reference Key Chart

Model No.	Fasteners	DF/SP Allowable Downloads (100)	Code Ref.
	Stud		
CF-R	(3) ¼" x 2" SDS	135	—
SBV	(4) ¼" x 2" SDS	130	

1. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

DS

Drywall Stop

Eliminates costly blocking at top plate, end walls, and corners. A typical residence will use several hundred of these inexpensive clips with a substantial savings in blocking and labor.

The installation prongs provide even more labor savings.

Material: 20 gauge

Finish: Galvanized

Installation:

- 16" on center or less, using 0.131" x 2½" nails
- DS should not be used where gypsum board is used for structural loads

Code Ref.: IBC®, FL, LA

SD

Wafer-Head Screw

The #8 x 1¼" SD Wafer-Head screw is ideal for miscellaneous fastening applications. The **Type-17** point ensures fast starts, and a deep #2 Phillips drive provides secure driver bit engagement.

Material: Heat-treated carbon steel

Finish: Electrogalvanized

Codes: See p. 13 for Code Reference Key Chart

Warning: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, use the #8 x 1¼" SD Wafer-Head screw in dry, interior and non-corrosive environments only.

Model No.	Size (in.)	DF/SP Allowable Loads	SPF/HF Allowable Loads	Code Ref.
		Shear (100) Steel Side Plate 10 ga. or Greater	Shear (100) Steel Side Plate 10 ga. or Greater	
SD8 x 1.25-R	5/8 x 1 1/4	50	45	—

1. The Wafer-Head SD8x1.25 wood screw requires ¾" minimum penetration. Do not use SD8x1.25 screws with structural connectors unless specified and stated in this catalog.

RC

Ripper Clip

The ripper clip is designed to connect ripped 2x framing to the top of another wood joist.

Material: 20 gauge

Finish: Galvanized

Installation:

- Use all specified fasteners; refer to General Notes
- Attach RC to ripper, then attach ripper/RC assembly to roof joist

Codes: See p. 13 for Code Reference Key Chart

Model No.	W (in.)	Fasteners (in.)		Allowable Uplift Load (160)	F ₁	F ₂	Code Ref.
		Ripper	Joist				
RC1.56	1 5/8						
RC1.81	1 13/16	(2) 0.148 x 1 1/2	(2) 0.148 x 1 1/2	205	240	205	—
RC2.1	2 1/8						

1. Allowable loads are for DF ripper members.

2. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

3. Designer to consider stability/blocking requirements for system, if necessary.

4. Spacing of RC per designer.

5. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

PSCL/PSCA

Panel Sheathing Clips

Simpson Strong-Tie panel sheathing clips are used to brace unsupported sheathing edges and provide a 1/8" gap to address shrinkage and expansion of roof sheathing.

Material: 20 gauge

Finish: Galvanized

Installation:

- Use the same size sheathing clip as the panel thickness
- Maximum spans may be reduced for low slopes or high uniform loads; refer to sheathing manufacturer's installation instructions

Codes: See p. 13 for Code Reference Key Chart

Span Rating	Panel Thickness (in.)	Model No.	Maximum Roof Sheathing Span		No. of Clips Per Span	Code Ref.
			With Clip	Without Clip		
24/0	3/8	PSCL3/8	24	20	1	—

1. Span rating and Maximum Roof Sheathing Spans are for reference only. Refer to IBC® Table 2304.8 (3) for additional important information.
2. Maximum roof sheathing span with a single PSCA is 28". For spans > 28", use two PSCAs.

Typical PSCL Installation
(PSCA similar)

MP

Mending Plates

Versatile and easy-to-use mending plates for wood-to-wood connections. No nails or notching of wood required. For non-structural applications only; not for truss applications.

Material: 20 gauge

Finish: Galvanized

Installation:

- Place plate over two pieces of aligned wood with arrows aligned at joint
- Place a wood block over the mending plate and hammer the wood block to embed the prongs

Codes: See p. 13 for Code Reference Key Chart

MP36
(other sizes similar)

Model No.	Dimensions (in.)		Code Ref.
	W	L	
MP14	1	4	—

1. Connectors are not load rated.

TP/TPA

Tie Plates

TPs are nail-on tie plates. TPAs are flanged for added support.

Material: 20 gauge

Finish: Galvanized

Installation:

- Holes are sized for 0.131" x 2½" nails or 0.131" x 1½" nails

Codes: See p. 13 for Code Reference Key Chart

SD Many of these products are approved for installation with Strong-Drive® SD Connector screws. See pp. 362–366 for more information.

TPA57	5	7	49	

1. Connectors are not load rated.

J/JP

Floor Beam Levelers

Jack piers and standard floor beam levelers offer unique leveling simplicity during and after construction.

Material: 12-gauge plates; ¾" threaded rod; 1 1⁄8" O.D. steel pipe

Finish: None

Installation:

- Use all specified fasteners; see General Notes
- Holes are provided for installation with (4) 0.148" x 1½" nails
- Do not use J/JPs for dynamic jacking of structures, such as houses

Codes: See p. 13 for Code Reference Key Chart

Model No.	Dimensions			DF/SP/SPF/HF Allowable Bearing Loads (100)	Code Ref.

J1621	16–21	15	10	4,380	
J2126	21–26	20	10	4,380	

1. Post design by designer. See strongtie.com/post for post allowable loads.
2. Loads may not be increased for duration of load.
3. **Fasteners:** Nail dimensions are listed diameter by length. See pp. 23–24 for fastener information.

IS

Insulation Supports

The insulation supports are cut from carbon steel spring wire for optimum flexibility and strength. Mitered tips dig into the wood, securing itself and insulation when installed between joists.

Material: 14 gauge

Finish: None

Installation:

- Install between joists. IS16 for 16" o.c. spacing; IS24 for 24" o.c. spacing. Follow insulation manufacturer's installation instructions.
- Wear safety glasses, gloves and other appropriate safety equipment.

Codes: See p. 13 for Code Reference Key Chart

IS16

IS24-R100	0.091	23½	24" o.c.	

CSC™/FSS™

Ceiling Support Clip / Furring Stabilizer Strap

Provides 1" separation between the furring channel and joist to allow for the use of Thermafiber® insulation and the attachment of the furring channel to all joists. Provides an efficient sound barrier, and a one-hour UL-listed fire rating.

- UL-listed. See Underwriters Laboratory, Inc. Design No. L530 for USG drywall and Weyerhaeuser/TJI® joists.
- Check Evaluation Reports for individual I-joist manufacturer approvals.

Material: 24 gauge (minimum)

Finish: Galvanized

Installation:

- For CSC use (1) 0.131" x 1½" nail
- For FSS use #8 self-tapping steel screw (not provided) into channel, twist 90°, bend upward and fasten to the side of joist bottom flange with screw or nail

Typical CSC and FSS Installation

Thermafiber® and TJI® are registered trademarks of US Gypsum Company and Weyerhaeuser, respectively.

Outdoor Accents®

Decorative Hardware

The Outdoor Accents decorative hardware product line features connectors and fasteners that bring beauty and strength to custom outdoor living structures. The two connector designs — Mission Collection® and Avant Collection™ — offer a choice of styles, from ornate and traditional to clean and simple. Both collections install with an innovative, load-rated hex-head washer and fastener combination, delivering the appearance of a bolt while providing the easy installation and convenience of a screw.

Outdoor Accents connectors include post bases to secure wood columns to concrete while providing a 1" stand-off height that helps reduce decay. These bases accommodate lumber in both nominal and rough sizes. Optional decorative side plates are available to give the look of a four-sided post base.

Angles make connections between beams and posts stronger and provide more consistent, straight corners for a variety of outdoor projects. Flat T and L straps provide reinforcement for connections where one lumber piece intersects another at a 90° angle. The deck joist tie attaches 2x joists to the side of 4x or larger support posts. Both collections also feature gable plates and decorative washers to add flair to any outdoor living project.

Additionally, the Essentials Collection features concealed flange hangers that work with both styles and the Accessories Collection features products that add decorative accents to any project.

Material: See tables

Finish: ZMAX® coating with black powder coat

Installation:

- Use all specified fasteners; see General Notes
- Outdoor Accents connectors must be installed with the Hex-Head Washer (STN22) and Structural Wood screw (SDWSDBB) combination. Some items require Strong-Drive® SD Connector screws.

Codes: See p. 13 for Code Reference Key Chart

Outdoor Accents® Essentials Collection

Outdoor Accents Fasteners

Outdoor Accents Connector Screw

The Outdoor Accents connector screw reduces installation time by driving easily without predrilling. Designed for installation with the Outdoor Accents APA21 90° angle and APLH light joist hangers, the screw's black finish accents any outdoor living project. The sharp point of the screw enables fast starts.

Features:

- Use with Outdoor Accents Decorative Hardware (sold separately) for an appealing look
- 1/4" hex head engages with driver bit for easier installation (1/4" hex drive bit included)
- Optimized heat treatment for ductility and strength
- The single-fastener steel-side-plate allowable load of the SD10 exceeds the shear load of a 0.162" x 3 1/2" nail
- Code listed in ICC-ES ESR-3046

Material: Carbon steel

Finish: Double-barrier black proprietary coating

SD10112DBB

Outdoor Accents Hex-Head Washer

While the Outdoor Accents patented hex-head washer provides the decorative appearance of a bolted connection, its patented design enables an easier and significantly faster installation time than through-bolting. The hex-head washer is designed to help fasten Outdoor Accents post bases, T and L straps, angles, gable plates and heavy joist hangers.

Features:

- Combined with the Outdoor Accents structural wood screw (SDWSDBB), it provides a structural load-rated solution
- Easy to install
- Code listed in IAPMO-UES ER-192

Finish: Quik Guard® black coating for exterior use

US Patents 10,253,801 and D733,546

Outdoor Accents Structural Wood Screw

The Outdoor Accents structural wood screw reduces installation time by driving easily without predrilling. When combined with the patented, load-rated Outdoor Accents hex-head washer, the solution delivers the decorative appearance of a bolt connection but with a much easier installation. The structural wood screw is now available in three sizes: 2", 3 1/2" and 5 1/2", and can be used with either the Mission Collection® or Avant Collection™, as well as separately to add flair to any outdoor project.

The 3 1/2" and 5 1/2" screws are ideal for structural applications. They feature a bold thread design that enables superior holding to attach ledgers and other secure connections. The 2" screw is ideal for use with 2x lumber, and for adding style to any DIY project. **Note:** The 2" screw has lower load values than the 3 1/2" and 5 1/2" screws. It may not be substituted where the longer screws are required.

The structural screw and washer are sold separately from each other and from the Outdoor Accents connectors.

Features:

- Use with Outdoor Accents Decorative Hardware and STN22 hex-head washer (sold separately) for an appealing look
- Use Outdoor Accents structural wood screw solitarily as a wood-to-wood fastener
- Patented SawTooth™ point (3 1/2" and 5 1/2") ensures fast starts, reduces installation torque and eliminates the need for predrilling in most applications; **Type-17 point on 2" screw ensures fast starts**
- Deep 6-lobe T40 recess makes driving easier (T40 drive bit included)
- Code listed IAPMO-UES ER-192

Finish: Double-barrier black proprietary coating

APBO-KT

APRT

Rigid Tie® Connectors

The Outdoor Accents® APRTC2, APRTR, APRTA12 and APRTA2 are designed to connect 2x lumber and are ideal for a variety of projects. These connectors can be used with either the Mission Collection® or Avant Collection™, as well as separately to add flair to any outdoor project. The APRTC2, APRTR and APRTA2 install with the Outdoor Accents #10 x 1½" connector screw. The APRTA12 installs with #8 x ¾" screws.

APRTC2 corner connector — Makes it easier to create strong and durable corner connections with 2x4 lumber — without using angle cuts or bolts. Ideal for building projects, such as a rustic outdoor dining table, beverage bar, garden potting table, workbench table or storage unit.

APRTR rail connector — connects horizontal 2x lumber to a vertical 2x. Ideal for a variety of projects including fences, railings and furniture.

APRTA2 and APRTA12 angles — provide a strong 90° connection without 45° cuts or angled fastening, making them ideal for gates, fences or any project where a 90° connection is desired.

Material: APRTC2 — 18 gauge; APRTR — 20 gauge; APRTA2 — 16 gauge; APRTA12 — 18 gauge

Finish: ZMAX® coating with black powder coat

Installation:

- Use all specified fasteners; see General Notes.
- Always follow manufacturer's instructions when using power tools and building equipment.
- Install vertical members first, then attach horizontal members for easier alignment.
- Seat wood member in bracket with a C-clamp before securing to aid positioning and prevent skewing.

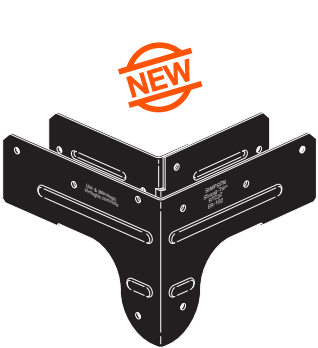

Codes: See p. 13 for Code Reference Key Chart

APGT

Gazebo Tie

The APGT Gazebo Tie series adds strength and rigidity to six-sided gazebo connections.

APGT2 — Connects 2x rafter and top plate to post in six-sided gazebo. Adds strength and rigidity to 3-way connection.

APGT6 — Connects six 2x rafters at top of six-sided gazebo.

APGTF — Connects bottom 2x rim joists to post in six-sided gazebo. Allows installation over post base for adjustable height of rim joists.

Material: APGT6 — 18 gauge;
APGT2, APGTF — 16 gauge

Finish: ZMAX® coating with black powder coat.

Installation:

- Use all specified fasteners. See General Notes.
- Minimum 2x6 rafter size.
- APGT6 — Bend one time only.

CPS/PBV

Standoff Bases

The PBV is a hidden standoff post base. Two different shapes fit a variety of posts sizes.

The CPS is a composite plastic standoff designed for increased concrete surface area.

Material: PBV — 14 gauge galvanized steel;
CPS — engineered composite polymer

Finish: PBV — Galvanized with black powder coat

To Order: For black powder coat, order PBV6PC or PBV10PC. For galvanized coating, order PBV6 or PBV10.

Installation:**PBV and CPS****Post:**

- Drill a ¾" diameter hole, 10" into the center of the post.
- Clean out dust. Fill hole halfway with Simpson Strong-Tie SET-3G™ anchoring adhesive.
- Insert all-thread rod and allow epoxy to set and cure.
- Secure standoff to post using four 0.148" x 3" nails except PBV which uses four Strong-Drive® SDS Heavy-Duty Connector screws (sold separately).

Concrete:

- Drill a ¾" diameter hole per anchor design (see footnote 2 below).
- Clean out dust. Fill hole halfway with Simpson Strong-Tie SET-3G, ET-3G™ or AT-3G™ anchoring adhesive. Insert post subassembly into hole and allow epoxy to set and cure.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-top-supported installations (such as fences or unbraced carports).

Codes: See p. 13 for Code Reference Key Chart

Typical PBV6PC Installation

Typical CPS4-R Installation

These products are made from non-corrosive materials.

PBV10PC	10" dia.	9 5/16	—	1	(4) ¼ x 3 SDS	5/8	3,800	21,435	

1. Allowable uplift load capacities are for solid sawn posts with a specific gravity of 0.36 minimum — except the PBV, which is based on round "Viga" (ponderosa pine) wood posts.
2. All allowable uplift loads are based on a lowest ultimate load from testing divided by a safety factor of 4. Concrete anchorage to be designed by others; refer to the Simpson Strong-Tie *Anchoring, Fastening, Restoration and Strengthening Systems for Concrete and Masonry* catalog at strongtie.com. Uplift loads shall not exceed those shown in the table.
3. Downloads are calculated based on the standoff bearing area and a concrete strength of 2,500 psi — except the PBV, which is based on the wood's bearing strength (700 psi for ponderosa pine).
4. Allowable loads may not be increased for the duration of the load.
5. **Fasteners:** Nail dimensions are listed diameter by length. SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.
6. Fasteners sold separately.

Indoor Architectural Products

Indoor Architectural Products consist of aesthetically pleasing, prefinished connectors and innovative concealed joist ties designed for exposed wood applications. These connectors provide structural performance while adding a unique appearance feature to a project. There are two styles available to meet different design needs. The Classic Collection features modern smooth edges and clean lines that work as well in a contemporary loft as they would in a century-old warehouse. The Rustic Collection features notched detailing to create the look and feel of a rugged cabin. Used with heavy timbers and beams, these connectors have an antique quality. The product group also features specialty connectors that can stand alone or work with any classic or rustic design. This group includes bearing plates, specialty joist hangers and custom plates.

- **Architectural Finishes**

Eliminate time-consuming prep work and costly field painting. Available finishes include black powder coat, gray paint and hot-dip galvanized coating.

- **Availability**

Select products are in stock and readily available. Contact Simpson Strong-Tie for product availability and lead times for non-stocked items.

- **Pre-Engineered and Tested**

Load-rated products are verified to perform to design loads, unlike custom-designed and -fabricated connectors.

- **Quality Assurance**

No-Equal® quality-controlled manufacturing ensures product consistency and high quality.

Products shown in this section come with black powder coat unless otherwise noted. Most are also available with a galvanized coating or gray primer. Contact Simpson Strong-Tie for availability.

strongtie.com/apg

Product information for the Classic Collection connectors can be found on pp. 80–81 and pp. 94–95.

- **Web Applications**

Model No.	Ga.	Dimensions (in.)			Minimum Bolt End and Edge Distances (in.)		Bolts		DF/SPF Allowable Loads		Code Ref.
		W	H	L	d ₁	d ₂	Qty.	Dia.	Tension/Uplift (100/160)	F ₁ (100/160)	
OL	12	2	12	12	2	3½	5	½"	1,435	565	—
OHL	7	2½	12	12	2½	4¾	5	⅝"	1,535	565	
OT	12	2	12	12	2	3½	6	½"	2,585	815	
OHT	7	2½	12	12	2½	4¾	6	⅝"	2,585	815	

1. OL, OHL, OT, and OHT must be installed in pairs, with bolts in double shear.

A single part with bolts in single shear is not load rated.

2. Allowable loads are based on a minimum member thickness of 3½".

3. OT, OHT loads assume a continuous beam.

4. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

Typical OL/OHL Installation

Typical OT/OHT Installation

Typical L Installation
(see p. 281 for model no.
and allowable loads)

Typical T Installation
(see p. 281 for model no.
and allowable loads)

These can be ordered with black powder coat.

Heavy Angles

Model No.	Ga.	Dimensions (in.)		Bolts		Code Ref.
		W	L	Quantity	Diameter	
OHA33	7	3½	3	2	¾"	—
OHA36	7	3½	6	4	¾"	

OHA

1. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

Indoor Architectural Products

Classic and Rustic Collection (cont.)

Strap Ties

Model No.	Ga.	Dimensions (in.)		Bolts		DF/SP/SPF/HF Allowable Loads	Code Ref.
		W	L	Qty.	Dia.	Tension/Uplift	
						(160)	
OS	12	2	12	4	½"	1,565	—
OHS	7	2½	12	4	⅝"	2,015	
OHS135	7	6	13½	4	¾"	5,045	
OHS195	7	6	19½	8	¾"	10,085	

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Allowable loads are based on parallel-to-grain loading and a minimum member thickness of 3½", with bolts in single shear. Straps must be centered at the splice joint, and bolt edge distances must meet NDS minimum requirements.
3. Designer must determine allowable loads when combining bolts parallel and perpendicular to grain.
4. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

Joist Hangers

Model No.	Ga.	Dimensions (in.)		Bolts		DF/SP Allowable Loads			Code Ref.
		W	H	Header	Joist	Uplift (160)	Floor (100)	Roof (125)	
OU46	7	3⅝	5	(2) ¾	(1) ¾	685	1,255	1,560	—
OU48	7	3⅝	7	(4) ¾	(2) ¾	1,365	2,510	3,120	
OU410	7	3⅝	9	(4) ¾	(2) ¾	1,365	2,510	3,120	
OU412	7	3⅝	11	(6) ¾	(3) ¾	2,050	3,770	4,680	
OU414	7	3⅝	13	(6) ¾	(3) ¾	2,050	3,770	4,680	
OU68	7	5½	7	(4) ¾	(2) ¾	1,365	2,510	3,120	
OU610	7	5½	9	(4) ¾	(2) ¾	1,365	2,510	3,120	
OU612	7	5½	11	(6) ¾	(3) ¾	2,050	3,770	4,680	
OU614	7	5½	13	(6) ¾	(3) ¾	2,050	3,770	4,680	
OU810	7	7½	9	(4) ¾	(2) ¾	1,365	2,510	3,120	
OU812	7	7½	11	(6) ¾	(3) ¾	2,050	3,770	4,680	
OU814	7	7½	13	(6) ¾	(3) ¾	2,050	3,770	4,680	

1. Load values allowed assume a carrying member of not less than 3½".
2. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
3. Additional glulam beam widths are available. Add an "X" to the name and specify width — e.g., OU68X, W = 5.25.
4. Skew and slope options are not available.
5. All references to bolts are for structural-quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM A307, Grade A.

Indoor Architectural Products

OHU™ — Ornamental Joist Hanger

The OHU ornamental joist hangers are heavy-duty, load-rated joist hangers that are attached with ¼" x 3" Strong-Drive® double-barrier coating SDS Heavy-Duty Connector screws (supplied with product).

Material: 12 gauge

Finish: Black powder coat

Options:

- No modifications

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

- Visit app.strongtie.com/hs to access our Hanger Selector web application.

Typical OHU Installation

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws. See pp. 23–24 for fastener information.

Special Order Parts

Simpson Strong-Tie can make a variety of flat and bent steel shapes, which include gusset plates for heavy timber trusses, custom ornamental shapes and retaining plates.

Material: 3 gauge maximum

Finish: Galvanized, black powder coat, Simpson Strong-Tie gray paint, stainless steel.

To Obtain a Quote:

- Supply a CAD drawing in .dxf format complete with plate dimensions, hole diameter and locations, steel thickness, desired finish (Simpson Strong-Tie gray paint, black powder-coat, HDG or raw steel)
- Total plate shape and size up to maximum dimensions of 48" x 48" (approx. ⅛" tolerance)
- Simpson Strong-Tie does not provide product engineering or load values for special order plates
- Contact Simpson Strong-Tie for pricing information
- Refer to General Notes, note g on p. 19 for additional information

"W" and "H" indicate the envelope size of the steel shape.

Typical Installation (plate shown has black powder coat)

Web Applications

Visit app.strongtie.com/agpd to access our Architectural Gable Plate Designer web application.

Indoor Architectural Products

UA/HUA™ — Heavy-Duty Joist Hangers

The UA/HUA hangers are heavy-duty, load-rated joist hangers that are attached with ¼" x 3" Strong-Drive® SDS Heavy-Duty Connector screws (supplied with product). These hangers can be ordered hot-dip galvanized for exterior use.

Finish: Black paint, black powder coat or hot-dip galvanized

Ordering:

Specify model number, W dimension and finish.

Ordering Examples:

- UA9 – W = 4.625 (For 3-ply 2x10) black paint.
- HUA24PC – W = 6.875 (For 6¾ x 24 glulam)
PC = Powder Coated.
- UA15HDG – W = 5.375 (For 5¼ x 16 PSL)
HDG = Hot-Dip Galvanized.
- HUA available with concealed flanges.
Specify HUAC.

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

Visit app.strongtie.com/hs to access our Hanger Selector web application.

Typical UA12 Installation

These products are available with additional corrosion protection. For more information, see p. 16.

1. Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.

2. Downloads are based on $F_c \perp = 565$ psi for DF/SP and $F_c \perp = 405$ psi for SPF/HF.

3. DF/SP allowable loads may be used for glulam, LVL, LSL, and PSL with minimum specific gravity = 0.50 and minimum $F_c \perp = 565$ psi.

4. Specify "W" dimension when ordering.

5. Header height shall be greater than or equal to hanger height.

6. Header thickness shall be 3" minimum.

7. **Fasteners:** SDS screws are Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws.

See pp. 23–24 for fastener information.

Fastener Application Guide

Bulk Strong-Drive® Connector Nails

Simpson Strong-Tie nails and structural fasteners have been developed as the optimum fasteners for connector products. Special lengths afford economy of purchase and installation, and depth compatibility with framing members.

Material: Carbon steel, stainless steel

For power-driven nails, see note "L" in General Instructions for the Installer, p. 20 and visit strongtie.com for technical bulletins.

Finish: Hot-dip galvanized, bright (no coating), 316 stainless steel

Web Applications: Visit app.strongtie.com/ff to access our Fastener Finderweb application.

1. Use HDG nails with ZMAX® and HDG products. Use stainless-steel nails with stainless-steel products.

2. HDG nails sold by Simpson Strong-Tie meet the specifications of ASTM A153 Class D. Stainless-steel nails are Type 316 stainless steel.

Collated Strong-Drive® Connector Nails

Simpson Strong-Tie carbon-steel Strong-Drive 33° SCN Smooth-Shank Connector nails and stainless-steel Strong-Drive 33° SCNR™ Ring-Shank Connector nails are designed to provide installers with a power-driven alternative to hand-driven nails. The nails are approved for use in many popular Simpson Strong-Tie products and serve as a replacement for ring-shank hand-driven common nails in a variety of Simpson Strong-Tie connector applications. Available in 25-nail, paper-tape collated strips.

Material: Carbon steel, hot-dip galvanized, bright (no coating), stainless-steel, ring shank

Finish: Hot-dip galvanized, bright (no coating), 316 stainless steel

Installation:

- Use all specified fasteners; see General Notes.
- For power-driven nails, see note "L" in General Instructions for the Installer, p. 20 and visit strongtie.com for technical bulletins.
- Follow the tool manufacturer's instructions and use the appropriate safety equipment.
- Tools with nail hole-locating mechanisms should be used.
- Paper-tape collated nails are compatible with a variety of popular power nailers. For more information, access our Fastener Finder software or download the Simpson Strong-Tie Fastening Systems catalog at strongtie.com.
- For applications involving alternate nails, refer to pp. 23–24.

Web Applications: Visit app.strongtie.com/ff to access our Fastener Finderweb application.

1. Use HDG nails with ZMAX® and HDG products.
2. HDG nails sold by Simpson Strong-Tie meet the specifications of ASTM A153 Class D. Stainless-steel nails are Type 316 stainless steel.

Strong-Drive® SDS HEAVY-DUTY CONNECTOR Screw

Structural Fastener

The Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screw is a 1/4"-diameter structural wood screw ideal for various connector installations as well as wood-to-wood applications. It installs with no predrilling and has been extensively tested in various applications.

For more information about package quantities, visit strongtie.com.

Features:

- The Type-17 point reduces installation torque and makes driving easier with no predrilling and minimal wood splitting.
- Available with a double-barrier coating or in Type 316 stainless steel. Carbon steel loads apply to corresponding stainless-steel models.
- 3/8" hex washer head is stamped with the No-Equal sign and fastener length for easy identification after installation.
- For the 3/8" hex-head driver bit, order model no. BITHEXR38-R1.

Material: Heat-treated carbon steel,
Type 316 stainless steel

Finish: Double barrier (all lengths);
Type 316 stainless steel (1 1/2" thru 3 1/2" lengths)

Codes: See p. 13 for Code Reference Key Chart

Web Applications:

- Visit app.strongtie.com/fd to access our Fastener Designer web application.
- Visit app.strongtie.com/ff to access our Fastener Finder web application.

These products are available with additional corrosion protection. For more information, see p. 16.

SS For stainless-steel fasteners, see p. 23.

1. Screws may be provided with the 4CUT™ or Type-17 point.
2. Strong-Drive SDS Heavy-Duty Connector screws install best using a low-speed 1/2" drill with a 3/8" hex-head driver.
3. Shear values are valid for connections between two members with full thread penetration into the main member. For other wood side plate values, see *Fastening Systems Technical Guide* (C-F-2023TECHSUP) at strongtie.com.
4. Allowable loads are shown at a wood load duration factor of $C_D = 1.0$. Loads may be increased for load duration per the building code up to a $C_D = 1.6$. Tabulated values must be multiplied by all applicable NDS adjustment factors.
5. Withdrawal loads shown are in pounds (lb.) and are based on penetration of the screw's entire threaded section into the main member. If thread penetration into the main member is less than the Thread Length as shown in the table for DF/SP, reduce allowable load by 172 lb./in. of thread not in main member. Use 121 lb./in. for SPF/HF.
6. Maximum withdrawal loads for wood side plates shall not exceed 345 lb. and 240 lb. for DF/SP and HF/SPF, respectively.
7. Fasteners per Carton represents the quantity of screws that are available in bulk packaging. Screws are also available in mini-bulk and retail packs. Refer to Simpson Strong-Tie *Fastening Systems* catalog (C-F-2023) at strongtie.com.
8. LSL wood-to-wood applications that require 4 1/2", 5", 6" or 8" SDS Heavy-Duty Connector screws are limited to interior-dry use only.
9. Where predrilling is required for Strong-Drive SDS Heavy-Duty Connector screws, predrill diameter is 5/32".
10. Minimum spacing, edge, and end distance requirements are listed in ICC-ES ESR-2236. For smaller spacing, please contact Simpson Strong-Tie Engineering.

Strong-Drive® SD CONNECTOR and SD CONNECTOR SS Screws

Structural Fastener

Simpson Strong-Tie offers the Strong-Drive SD Connector (SD) and SD Connector SS (SD SS) screws for use with our connectors. Designed to replace nails in certain products, the load-rated SD and SD SS screws have been tested and approved for use in many popular Simpson Strong-Tie connectors. In certain applications screws are easier and more convenient to install than nails, and the single-fastener load values achieved by the SD9 and SD10 exceed those of typical 0.148" x 3" or 0.162" x 3½" nails, respectively.

When selecting fasteners for connectors, match both the base metal and corrosion resistance to maximize connection durability. Stainless steel connector screws should be used with stainless steel connectors. Galvanized screws should be used with galvanized connectors. When galvanized and stainless steel parts are used together, galvanic corrosion can occur because the two metals (zinc and stainless steel) are electrochemically dissimilar. If the screw is galvanized and the connector is stainless steel, corrosion of the screw would begin with sacrifice of the zinc in the galvanized coating and then proceed with corrosion of the steel screw. Whether due to a galvanic or oxidative electrochemical process, corrosion can lead to the need for premature repair or failure of the connection.

The SD and SD SS screws feature an optimized shank, specifically designed for compatibility with the fastener holes in Simpson Strong-Tie connectors. The hex head allows for a secure drive and helps avoid stripping of the head during installation. The sharp point of the screw enables fast starts.

Features:

- Tested and approved for use in many of our best-selling connectors for interior and most exterior applications.
- The single-fastener steel-side-plate load capacity of the SD9 exceeds the capacity of a 0.148" x 3" nail, while the single-fastener load capacity of the SD10 exceeds that of the 0.162" x 3½" nail.
- Ideal for use in tight spaces where using a hammer is inconvenient.
- Optimized heat-treating for ductility and strength.
- Mechanically galvanized coating meets ASTM B695 Class 55, is recommended for use with certain preservative-treated woods and recognized as an alternate to hot-dip galvanized in ESR-3046. It is compliant with the 2009, 2012, 2015, 2018 and 2021 International Residential Code® (Section R317.3.1).
- ¼" hex-drive bit included.
- Head identification.

Material: SD Screw — Heat-treated carbon steel, mechanically galvanized (ASTM B695 Class 55); SD SS Screw — Type 316 stainless steel

Codes: See p. 13 for Code Reference Key Chart

U Hangers	See p. 24 for face-mount hanger fastener substitutions and reduction factors.			
VTOR	(7)	—	—	—

- Where indicated, published allowable loads are for installation with #10 SD Connector screws. Multiply allowable loads by 0.83 to obtain allowable loads for #9 SD Connector screws.
- Stainless-steel connectors use #9 SD Connector SS screws and have the same allowable loads as carbon steel #9 SD Connector screws.
- Strong-Drive SD Connector screw substitutions may have load reductions. For additional information and specific allowable loads, refer to strongtie.com/sd.
- Fasteners:** SD screws are Simpson Strong-Tie Strong-Drive SD Connector screws. See pp. 23–24 for fastener information.

Titen Turbo™

Concrete and Masonry Screws

The Titen Turbo concrete and masonry screw anchor features a patented Torque Reduction Channel that displaces dust where it can't obstruct the thread action, reducing the likelihood of binding in the hole. The Titen Turbo is available in 3/16" and 1/4" diameter with either a hex head (required for use with connectors) or, for other material installations, a 6-lobe-drive countersunk head. The pointed tip allows for easy attachment of wood to concrete or for wood-to-wood applications. For more information, visit go.strongtie.com/titenturbo.

Material: Carbon steel

Coating: Zinc plated with baked-on ceramic coating

Codes: IAPMO UES ER-712 (uncracked concrete) (City of LA Supplement within ER-712); IAPMO UES ER-716 (masonry) (City of LA Supplement within ER-716); FL16230 (concrete and masonry)

For proper installation sequence, see installation requirements in IAPMO UES ER-712 (Concrete) and ER-716 (Masonry).

Web Applications: Visit app.strongtie.com/adc to access our Anchor Designer software.

Titen Turbo Screw Anchor Warning:

Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, use this product in dry and noncorrosive environments only, or provide moisture barrier. Steps must be taken to prevent inadvertent sustained loads above the listed allowable loads. Overtightening and bending can initiate cracks detrimental to the hardened screw's performance. Use the Simpson Strong-Tie Titen Turbo installation tool kit (part TNTINSTALLKIT); it has a bit that is designed to reduce the potential for overtightening the screw.

Titen Turbo Allowable Loads in Normal-Weight Concrete
(f'c = 2,500 psi)

Anchor Diameter (in.)	Drill Bit Diameter (in.)	Embedment Depth (in.)	Critical Edge Distance, C _{ac} (in.)	Minimum Edge Distance, C _{min} (in.)	Minimum Spacing (in.)	Static Allowable Loads		Wind Allowable Loads	
						Tension	Shear	Tension	Shear
3/16	5/32	1 3/4	3	1 3/4	1	460	205	385	170
				3		705	205	590	170
1/4	3/16	1 3/4	3	1 3/4	2	430	295	360	250
				3		705	310	590	260

1. Static allowable loads are calculated based on the strength design provision of ACI 318-14 Chapter 17 using a conversion factor of $\alpha = 1.4$. The conversion factor α is based on the load combination 1.2D + 1.6L assuming 50% dead load and 50% live load: $1.2(0.5) + 1.6(0.5) = 1.4$.
2. Wind allowable loads are calculated based on the strength design provision of ACI 318-14 Chapter 17 using a conversion factor of $\alpha = 1/0.6 = 1.67$. The conversion factor α is based on the load combination assuming 100% wind load.
3. Tabulated values are calculated with C_{min} on one side and C_{ac} on three sides.
4. Tabulated values are for a single anchor with no influence of another anchor.

Titen Turbo Allowable Loads in CMU

Anchor Diameter (in.)	Drill Bit Diameter (in.)	Embedment Depth (in.)	Minimum Edge Distance (in.)	End Distance (in.)	Minimum Spacing (in.)	Allowable Load (f'm ≥ 1,500 psi) (lb.)			
						UngROUTED CMU		GFCMU	
						Tension	Shear	Tension	Shear
3/16	5/32	1 1/4	3 3/8	3 3/8	3	117	164	—	—
		2	3 3/8			—	—	267	218
		2	1 1/2			—	—	267	218
1/4	3/16	1 1/4	3 3/8	3 3/8	4	117	190	—	—
		2	3 3/8			—	—	393	342
		2	1 1/2			—	—	343	283

1. The allowable loads listed are based on a safety factor of 5.0 for CMU.
2. Allowable loads may not be increased for the duration of the load.
3. The attached member or element may govern the allowable load. The designer shall verify allowable load.
4. Refer to strongtie.com for additional information on the Titen Turbo.

US Patent 11,002,305

Available in blue, white, bronze, silver and — coming soon — black. See strongtie.com.

Titen Turbo Hex Head

Titen Turbo 6-Lobe Head

Titen HD® Heavy-Duty Screw Anchor

A high-strength screw anchor for use in cracked and uncracked concrete, as well as uncracked masonry. The Titen HD offers low installation torque and outstanding performance. **Zinc-plated Titen HD** is designed for use in dry, interior, non-corrosive environments or temporary outdoor applications. **Mechanically galvanized Titen HD** is for both interior and exterior applications.

Features

- Qualified for static and seismic loading conditions
- Thread design undercuts to efficiently transfer the load to the base material
- Standard fractional sizes
- Specialized heat-treating process creates tip hardness for better cutting without compromising the ductility
- No special drill bit required — designed to install using standard-sized ANSI tolerance drill bits
- Hex-washer head requires no separate washer, unless required by code, and provides a clean installed appearance

Codes: ICC-ES ESR-2713 (concrete); ICC-ES ESR-1056 (masonry); City of LA Supplement within ESR-2713 (concrete); City of LA Supplement within ESR-1056 (masonry); Florida FL15730 (concrete and masonry); FM 3017082, 3035761 and 3043442; Multiple DOT listings

Material: Carbon steel

Coating: Zinc plated or mechanically galvanized.

Titen HD
Screw Anchor

Stainless-Steel Titen HD Heavy-Duty Screw Anchor

The Titen HD stainless-steel screw anchor for concrete and masonry is ideal for when the job calls for fast and efficient installation in multiple types of environments. The Titen HD stainless steel is a state-of-the-art anchor solution that combines the long-lasting corrosion resistance of Type 300 Series stainless steel with the undercutting ability of heat-treated carbon-steel threads.

Innovative — The serrated carbon-steel threads on the tip of the stainless-steel Titen HD are vital because they undercut the concrete as the anchor is driven into the hole, making way for the rest of the threads to interlock with the concrete. In order for these threads to be durable enough to cut into the concrete, they are formed from carbon steel that is then hardened and brazed onto the tip of the anchor.

Corrosion Resistant — For dry, interior applications, carbon-steel corrosion is not a risk, but in any kind of exterior, coastal or chemical environment, stainless steel provides the best solution for corrosion protection.

Features:

- Ideal for exterior or corrosive environments
- Installs with an impact wrench or with a hand tool
- Tested per ACI355.2, AC193 and AC106

Codes: IAPMO UES ER-493 (concrete); ICC-ES ESR-1056 (masonry); City of LA Supplement within ER-493 (concrete); City of LA Supplement within ESR-1056 (masonry); Florida FL15730 (masonry); FL16230 (concrete)

Material: Type 316 and Type 304 stainless steel with carbon-steel lead threads

Additional Installation Information for Titen HD and Stainless-Steel Titen HD

Titen HD® Diameter (in.)	Wrench Size (in.)	Recommended Steel Fixture Hole Size (in.)	Minimum Hole Depth Overdrill (in.)
1/4	3/8	3/8 to 7/16	1/8
3/8	9/16	1/2 to 5/8	1/4
1/2	3/4	5/8 to 11/16	1/2
5/8	15/16	3/4 to 13/16	1/2
3/4	1 1/8	7/8 to 15/16	1/2

Suggested fixture hole sizes are for structural steel thicker than 12 gauge only. Larger holes are not required for wood or thinner cold-formed steel members.

SET-3G™ High-Strength Epoxy Adhesive

SET-3G is an epoxy-based anchoring adhesive with high design strength and proven performance. SET-3G is a 1:1 ratio, two-component, anchoring adhesive for concrete (cracked and uncracked). SET-3G installs and performs in a variety of environmental conditions and temperature extremes.

Features

- Exceptional performance — superior bond strengths permit ductile solutions in high seismic areas
- Design flexibility — improved sustained load performance at elevated temperature
- Jobsite versatility — can be specified for all base material conditions when in-service temperatures range from -40°F (-40°C) to 176°F (80°C)
- Approved for dry, water-saturated concrete, water-filled holes, and submerged (underwater) hole installations
- Recognized per ICC ES AC308 for post-installed rebar development and splice length design provisions
- Approved for installation with multiple vacuum-drill bit systems without further hole cleaning. See Code Report (ESR-4057) and engineering letter at strongtie.com for approved systems.

Product Information

Mix Ratio/Type	1:1 epoxy
Mixed Color	Gray
Base Materials	Concrete and masonry — cracked and uncracked
Base Material Conditions	Dry, water-saturated, water-filled hole, submerged
Anchor Type	Threaded rod or rebar
Substrate Installation Temperature	40°F (4°C) to 100°F (38°C)
In-Service Temperature Range	-40°F (-40°C) to 176°F (80°C)
Storage Temperature	45°F (7°C) and 90°F (32°C)
Shelf Life	24 months
Volatile Organic Compound (VOC)	2 g/L
Manufactured in the US using global materials	

Test Criteria

SET-3G has been tested in accordance with ICC-ES AC308, AC58, ACI 355.4 and applicable ASTM test methods.

Code Reports, Standards and Compliance

Concrete — ICC-ES ESR-4057 (including post-installed rebar connections, City of LA and Florida Building Code), Florida FL15730.
Masonry — ICC-ES ESR pending.
ASTM C881 and AASHTO M235 — Types I/IV and II/IV, Grade 3, Class B & C.
UL Certification — CDPH Standard Method v1.2.
NSF/ANSI/CAN 61 (216 in.² / 1,000 gal.).

SET-3G Adhesive Cartridge System

Model No.	Capacity (ounces)	Cartridge Type	Carton Quantity	Dispensing Tool(s)	Mixing Nozzle ³
SET3G10 ⁴	8.5	Coaxial	12	CDT10S	EMN22I
SET3G22-N ⁴	22	Side-by-side	10	EDT22S, EDTA22P, EDTA22CKT	
SET3G56	56	Side-by-side	6	EDTA56P	

1. Cartridge estimation guidelines are available at strongtie.com/softwareandwebapplications/category.
2. Detailed information on dispensing tools, mixing nozzles and other adhesive accessories is available at strongtie.com.
3. Use only Simpson Strong-Tie mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair SET-3G adhesive performance.
4. One EMN22I mixing nozzle and one extension are supplied with each cartridge.
5. Use of rodless pneumatic tools to dispense single-tube, coaxial adhesive cartridges is prohibited.

SET-3G Adhesive

Installation Instructions

Installation instructions are located at the following locations: *Anchoring, Fastening, Restoration and Strengthening Systems for Concrete and Masonry* catalog; product packaging; or strongtie.com.

- For information on hole cleaning brushes, visit strongtie.com.

AT-3G™ High-Strength Hybrid Acrylic Adhesive

AT-3G is a hybrid, acrylic-based adhesive for anchoring threaded rod and rebar into cracked and uncracked concrete. Ideal for cold weather and wet concrete applications, AT-3G dispenses easily and offers a fast curing time for same-day bolt up.

Features

- Excellent for use in cold weather conditions or applications where fast cure is required
- Recognized per ICC-ES AC308 for threaded rod and rebar anchoring, along with post-installed rebar development and splice length design provisions
- Conventional blow-brush-blow hole cleaning technique using a wire brush — no power brushing required

Web Applications

- Visit app.strongtie.com/adc to access our Anchor Designer Software.
- Visit app.strongtie.com/ace to access our Adhesive Cartridge Estimator Software.

Product Information

Mix Ratio/Type	10:1 hybrid acrylic
Mixed Color	Gray
Base Materials	Concrete — cracked and uncracked
Base Material Conditions	Dry, water-saturated, water-filled hole
Anchor Type	Threaded rod or rebar
Substrate Installation Temperature	23°F (–5°C) to 104°F (40°C)
In-Service Temperature Range	–40°F (–40°C) to 320°F (160°C)
Storage Temperature	41°F (5°C) and 77°F (25°C)
Shelf Life	18 months
Volatile Organic Compound (VOC)	41 g/L

Test Criteria

AT-3G has been tested in accordance with ICC-ES AC308, ACI 355.4 and applicable ASTM test methods.

Code Reports, Standards and Compliance

AT-3G Adhesive

Simpson Strong-Tie Limited Warranty

Effective Date: March 18, 2021

This Limited Warranty applies to all Simpson Strong-Tie products ("Products") purchased after the Effective Date while this Limited Warranty remains in effect, other than those Simpson Strong-Tie products that have a separate Limited Warranty applicable to such products. For purchases after the Effective Date, please consult strongtie.com/limited-warranties, as this Limited Warranty may be updated by Simpson from time to time. All future purchases of Products are subject to the terms of the Limited Warranty in effect as of the purchase date.

This Limited Warranty must be read in conjunction with all applicable General Notes, General Instructions for the Installer, General Instructions for the Designer, Building Codes, Corrosion Information, and Terms & Conditions of Sale, along with any other information or specifications published by Simpson Strong-Tie Company Inc. ("Simpson") or available on the strongtie.com website ("Website") or on the product package, label or product manual. All of this information is referred to collectively as the "Simpson Strong-Tie Documentation." All applicable Simpson Documentation must be carefully reviewed each time any Product is used.

Simpson Strong-Tie warrants, to the original purchaser only, that each Product will be free from substantial defects in materials, manufacturing and design if properly specified, installed, and maintained, and when used in accordance with the design limits and the structural, technical, and environmental specifications in the Simpson Strong-Tie Documentation. This Limited Warranty is void and does not apply to any (a) Product purchased from an unauthorized dealer, retailer or distributor, (b) Product deterioration or damage due to environmental conditions or inadequate or improper handling, transportation, storage or maintenance, (c) cosmetic defects, including discoloration, (d) failure or damage caused by improper installation, application, mixing or preparation, (e) use of a Product in temperatures or environmental conditions outside the ranges specified for such Product in the Simpson Strong-Tie Documentation, (f) use of a Product outside of its shelf-life specifications, (g) normal wear and tear, (h) failure or damage caused by the use of a Product with any fasteners, pins, screwstrips, products or accessories other than authentic Simpson Strong-Tie products, (i) Product that was subjected to negligence or excessive or improper use, including any use not in accordance with the Simpson Strong-Tie Documentation, (j) failure or damage caused by the building site, foundation, or any third-party products, building materials or components, (k) failure or damage caused by use of a Product in a structure that has a design or other defect or that does not comply with all applicable building codes, laws, rules and regulations, (l) modified Product, or any nonstandard use or application of a Product, (m) failure or damage caused by corrosion, termites or other wood destroying organisms, animal or insect activity, wood fungal decay, rot, mold, mildew, exposure to chemicals or other hazardous substances, a corrosive environment or materials, inadequate moisture protection, or premature deterioration of building materials, (n) failure or damage caused by an act of God, including any hurricane, earthquake, tornado, lightning, ice, snow, high wind, flood or other severe weather or natural phenomena, (o) installation services or workmanship, including any failure or damage caused by installation of any Product, whether or not in accordance with the Simpson Strong-Tie Documentation, or (p) failure or damage caused by the gross negligence, willful misconduct, or other acts or omissions of the builder, general contractor, installer or any third party, including the building owner. Notwithstanding the foregoing, Simpson Strong-Tie disclaims and does not provide any warranty related to the design of any custom-order or non-catalog Product.

Although Products are designed for a wide variety of uses, Simpson Strong-Tie assumes no liability for confirming that any Product is appropriate for an intended use, and each intended use of a Product must be reviewed and approved by qualified professionals. Each Product is designed for the load capacities and uses listed in the Simpson Strong-Tie Documentation, subject to the limitations and other information set forth in the Simpson Strong-Tie Documentation.

Due to the particular characteristics of potential impact events such as earthquakes and high velocity winds, the specific design and location of the structure, the building materials used, the quality of construction, or the condition of the soils or substrates involved, damage may nonetheless result to a structure and its contents even if the loads resulting from the impact event do not exceed Simpson Strong-Tie's specifications and the Products are properly installed in accordance with applicable building codes, laws, rules and regulations.

Product demonstrations, training, operator examinations, technical and customer support and other services provided by Simpson Strong-Tie are based on Simpson Strong-Tie's present knowledge and experience, are

conducted for illustrative or instructive purposes only, do not constitute a warranty of Product capabilities, specifications or installation and do not modify the applicable Limited Warranty for Products set forth herein. Any services provided by Simpson Strong-Tie are provided without any representation or warranty of any kind, and Simpson Strong-Tie assumes no liability for any representations or statements made as part of such Product demonstrations, training, operator examinations or other services. In the event of any inconsistency between any information provided during any such demonstration or service, and the information in any applicable Simpson Strong-Tie Documentation, the information in the Simpson Strong-Tie Documentation shall govern. In the event of any inconsistency between any information provided on the Website, and the information in any other Simpson Strong-Tie Documentation, the information on the Website shall govern.

ALL WARRANTY OBLIGATIONS OF SIMPSON STRONG-TIE SHALL BE LIMITED, AT SIMPSON STRONG-TIE'S ABSOLUTE DISCRETION, TO EITHER REPAIRING THE DEFECTIVE PRODUCT OR PROVIDING A REPLACEMENT FOR THE DEFECTIVE PRODUCT. THIS REMEDY CONSTITUTES SIMPSON STRONG-TIE'S SOLE OBLIGATION AND LIABILITY AND THE SOLE AND EXCLUSIVE REMEDY OF PURCHASER AND, WITHOUT LIMITING THE GENERALITY OF THE FOREGOING, EXCLUDES ANY LABOR OR OTHER COSTS INCURRED IN CONNECTION WITH A WARRANTY CLAIM. PURCHASER ASSUMES ALL RISK AND LIABILITY ASSOCIATED WITH ANY USE OF THE PRODUCT, INCLUDING BUT NOT LIMITED TO SUITABILITY FOR ITS INTENDED USE.

THE LIMITED WARRANTY HEREIN IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, AND, WHERE LAWFUL, SIMPSON STRONG-TIE DISCLAIMS ALL OTHER WARRANTIES, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE AND WARRANTIES ARISING FROM COURSE OF PERFORMANCE, COURSE OF DEALING OR TRADE USAGE. IN NO EVENT WILL SIMPSON STRONG-TIE BE LIABLE FOR INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR SPECIAL DAMAGES OR DIRECT OR INDIRECT LOSS OF ANY KIND, INCLUDING BUT NOT LIMITED TO PROPERTY DAMAGE, DEATH AND PERSONAL INJURY. SIMPSON STRONG-TIE'S ENTIRE LIABILITY IS LIMITED TO THE PURCHASE PRICE OF THE DEFECTIVE PRODUCT. SOME STATES DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, OR THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION MAY NOT APPLY TO YOU. THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS, AND YOU MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

To obtain warranty service, you must contact Simpson Strong-Tie promptly at (800) 999-5099 or at Simpson Strong-Tie Company Inc., 5956 West Las Positas Boulevard, Pleasanton, CA 94588, regarding any potential claim, no later than sixty (60) days after you discover the potential claim. Upon request by Simpson Strong-Tie, you must provide Simpson Strong-Tie with: (a) proof of purchase and written records evidencing, in reasonable detail, the date and manner of installation, application, mixing and preparation of the Products, as applicable, (b) a reasonable opportunity to inspect the site where the Product was installed, and (c) samples of the Products from the actual installation in sufficient quantities in order for Simpson Strong-Tie to perform testing to determine whether or not the Product failed as set forth herein. Simpson Strong-Tie may, in its absolute discretion, request that you return the allegedly defective Products to Simpson Strong-Tie, in which case Simpson Strong-Tie will issue a Return Materials Authorization (RMA), which must be completed and returned to Simpson Strong-Tie with the Product. Simpson Strong-Tie is not responsible for any costs or expenses incurred in connection with any inspection (other than by Simpson Strong-Tie employees) or in connection with the return of Products to Simpson Strong-Tie, but Simpson Strong-Tie shall bear all costs and expenses incurred in connection with the shipment of replacement Products in the event that Simpson Strong-Tie determines that the Product should be replaced in accordance with this Limited Warranty. If Simpson Strong-Tie elects to repair or replace the Product, Simpson Strong-Tie shall have a reasonable time to do so.

No one is authorized to change or add to this Limited Warranty. If at any time Simpson Strong-Tie does not enforce any of the terms, conditions or limitations stated in this Limited Warranty, Simpson Strong-Tie shall not have waived the benefit of said term, condition or limitation and can enforce it at any time. This Limited Warranty is extended only to the original purchaser and is not transferrable. It is not intended nor shall it be construed to create rights in any third party.
